Summary
Influenza activity continues to decrease across the state of Texas. It appears that influenza activity peaked in late January. Compared to the previous week, the percentage of patient visits due to influenza-like illness (ILI) and the percentage of specimens testing positive for influenza reported by public health and hospital laboratories has marginally decreased. Two influenza-associated pediatric deaths were reported. Nineteen ILI or influenza-associated outbreaks were reported. In addition to flu, other respiratory viruses—especially rhinovirus/enterovirus—were detected in Texas during week 09.

Laboratory Results

Influenza
Hospital laboratories across Texas voluntarily report influenza tests (antigen, culture, and PCR) to the National Respiratory and Enteric Virus Surveillance System (NREVSS). Providers throughout Texas also submit specimens for influenza testing (PCR) to Texas public health laboratories, including the Texas Department of State Health Services (DSHS) state laboratory in Austin and the nine Texas Laboratory Response Network (LRN) laboratories. The results reported by Texas NREVSS participants and public health laboratories for the current week are summarized in the two tables below. Additional influenza test results (rapid tests, culture, PCR) and ILI activity were reported from providers and public health departments throughout the state (see county map at the end of this report).

*Other denotes specimens with coinfections (i.e. one specimen was positive for both influenza A (H1N1) and influenza A (H3N2))
Other Respiratory Viruses

The NREVSS system collects information on a variety of respiratory viruses in addition to influenza including parainfluenza virus, respiratory syncytial virus (RSV), rhinovirus, human metapneumovirus (HMPV), seasonal coronavirus, and respiratory adenovirus. The results for the current week are summarized below.

Table 4: Non-Influenza Respiratory Virus Testing Performed by Texas NREVSS Laboratories for the Current Week

Antigenic Characterization

Since October 01, 2017, CDC has reported antigenic characterization results from thirteen influenza A (H3N2) viruses, nine influenza A (H1N1) viruses and five influenza B virus received from the Texas Department of State Health Services (DSHS) Laboratory, the Dallas County Health and Human Services Laboratory Response Network (LRN) Laboratory, and the San Antonio LRN Laboratory. The DSHS Laboratory and the two LRN laboratories send a representative sample of influenza viruses to the CDC throughout the flu season.

Influenza A (H3N2) [13]
- Thirteen (100.0%) viruses were related to A/Hong Kong/4801/2014 virus, the influenza A (H3N2) component of the 2017-2018 Northern Hemisphere influenza vaccine.

Influenza A (H1N1) [9]
- Nine (100%) viruses were related to A/Michigan/45/2015 (H1N1). This virus strain was included in the 2017-2018 influenza vaccine for the Northern Hemisphere.

Influenza B [5]
- Victoria lineage [0]
- Yamagata lineage [5]: Five (100.00%) influenza B/Yamagata-lineage virus has been characterized from Texas. A B/Phuket/3073/2013-like virus, which belongs to the B/Yamagata lineage, is included as an influenza B component of the 2017-2018 Northern Hemisphere quadrivalent influenza vaccine.

Variant Influenza Viruses
No variant or novel influenza viruses have been detected in Texas during the 2017-2018 season.

Institutional Outbreaks and School Closures
Eleven influenza-associated outbreaks were reported in institutions during week 09 in four different regions at long-term care facilities. HSR 2/3 reported 7 outbreaks. Three of those outbreaks had positive test results for influenza A, 3 had positive test results for influenza, and one had positive test results for influenza A and B. In HSR 6/5S, one outbreak due to influenza A was reported. One outbreak due to influenza was reported in HSR 7. Two outbreaks, one due to influenza A and one due to influenza B, were reported in HSR 8. Various control measures such as limiting the movement of staff, isolation of the ill, and distributing prophylaxis were implemented at the facilities.

Two school closures, 2 school outbreaks, and 4 daycare outbreaks were reported during week 09 in two different HSRs. HSR 2/3 reported 2 school closures, 1 school outbreak and 4 daycare outbreaks all due to ILI. HSR 6/5S reported one school outbreak due to ILI.
TX P&I Mortality Surveillance Data

Pneumonia and influenza (P&I) death data are obtained from death certificates of Texas residents whose underlying or contributing cause(s) of death is reported as pneumonia or influenza. P&I deaths are identified based on ICD-10 multiple cause of death codes. In particular, P&I deaths are based on ICD-10 pneumonia and influenza mortality codes.

Five thousand two hundred and twenty-eight P&I deaths have been reported in Texas during the 2017-2018 influenza season.

Influenza-Associated Pediatric Mortality

Three influenza-associated pediatric deaths were reported in week 09 in two different regions. Two of the deaths were reported in HSR 6/5S. The first influenza-associated pediatric death was reported in a 10-year-old child with underlying conditions. The death occurred during MMWR week 06 (week ending February 10). A specimen collected from the child was positive for influenza A (H3N2) by PCR. It is unknown if the child received the influenza vaccine for the current season. The second influenza-associated pediatric death was reported in a child under one with underlying conditions. The death occurred during MMWR week 08 (week ending March 3). A specimen collected from the child was positive for influenza A (H1N1) by PCR. It is unknown if the child received the influenza vaccine for the current season. The third death was reported in HSR 9/10 in a 3-year-old child with underlying health conditions. The death occurred during MMWR week 6 (week ending February 10). A specimen collected from the child was positive for influenza B/Yamagata. The child was not vaccinated for the current season.

Eleven influenza-associated pediatric death has been reported in Texas during the 2017-2018 influenza season. Cases of influenza-associated pediatric mortality (children <18 years of age) are reportable year-round and by law in Texas.

Statewide Influenza Activity Map

Figure 5: Texas Map Displaying the Highest Level of Influenza or ILI Activity Reported by County for the Week Ending Mar. 3, 2018 (MMWR Week 09)

Please note: The majority of influenza cases are not reportable by law in Texas. This map contains data from sentinel sites and only displays influenza and ILI cases that were reported to public health. Positive laboratory results are reported according to specimen collection date, or date received in the laboratory if the former is unknown.
Texas Influenza Surveillance Components and Measures

Activity codes (see http://www.cdc.gov/flu/weekly/overview.htm)

Statewide influenza activity level
A code reported weekly by states and territories to CDC indicating the geographic spread of influenza in the state. Levels are no activity, sporadic, local, regional, and widespread.

ILINet Activity Indicator
A statewide level of influenza-like illness intensity (on a scale of 1-10, with 1 being the lowest level) assigned to each state weekly by CDC based on data reported through ILINet.

Morbidity

Novel/variant influenza
Thorough investigations are performed on all cases of novel/variant influenza. This condition is reportable by law in Texas.

Texas ILINet
Providers voluntarily report weekly to CDC’s ILINet system on the number of outpatient visits for ILI and total outpatient visits. Providers may submit up to 5 specimens per month for influenza testing. See http://www.dshs.state.tx.us/idcu/disease/influenza/surveillance/ILINet/ for information on how to become an ILINet provider.

ILI activity
Non-ILINet providers report ILI or influenza data weekly to local or regional health departments.

Outbreaks
Healthcare, schools, childcare, and correctional facilities report ILI and influenza outbreaks to health departments in Texas. This condition is reportable by law in Texas.

Mortality

Pneumonia and Influenza (P&I) Mortality Surveillance
The DSHS Vital Statistics Unit collects death certificate information for all deaths on Texas residents from various partners such as funeral homes and local registrars around the state. The death certificates are then sent to the National Center for Health Statistics (NCHS) where the cause of death and underlying causes of death on the death certificates are coded with ICD-10 mortality codes. Once death certificates are coded, the information is sent back to DSHS Center for Health Statistics (CHS). CHS produces a Weekly Pneumonia and Influenza (P&I) Death Report and sends it to the State Influenza Surveillance Coordinator for inclusion in the Texas Weekly Flu Report. P&I deaths are identified based on ICD-10 multiple cause of death codes, and in particular, pneumonia and influenza mortality codes. Delays inherent in death reporting and coding practices may cause the number of reported P&I deaths to vary considerably each week.

Influenza-associated pediatric deaths
Deaths that are associated with influenza in children < 18 years of age are reported to health departments in Texas. This condition is reportable by law in Texas. http://www.dshs.state.tx.us/idcu/disease/IAPM/

Laboratory

DSHS Austin laboratory
Providers voluntarily submit specimens to the DSHS Austin laboratory for influenza PCR testing throughout the season. Providers sign up for this program through their local health departments.

Laboratory Response Network (LRN) laboratories
Providers voluntarily submit specimens to one of the 9 Texas LRNs for influenza PCR testing throughout the season. Providers sign up for this program through their local health departments.

NREVSS
Laboratories voluntarily report influenza and other respiratory virus data weekly through the CDC’s online NREVSS reporting system. Laboratories sign up for this program by contacting DSHS. http://www.cdc.gov/surveillance/nrevss/
