Note about LCODE:

The "Census Block" and "Census Block Group" coding are geographic identifiers derived from a process called Geocoding. Geocoding is the process of assigning a geographic coordinate to a record for a given physical address. LCODE (Location code) quantifies the level of accuracy of the geocoding process. LCODE classification:

- "A" code indicates that the record is accurate to the address level.
- "Z" code indicates the record is accurate to at least the ZIP code level.
  - "ZB" code indicates the record is accurate to the Census Block Group level.
  - "ZT" code indicates the record is accurate to at least the Census Tract level.
- An "E" code indicates an error in geocoding and no value is provided.

The Block Group should be a 12-digit numerical value. If the LCODE is "ZT" or "ZC" a record should not have a value for Block Group. The LCODE will be included any time a data request includes Pat\_Addr\_Census\_Block or Pat\_Addr\_Census\_Block\_Group.
