General Comments on 2nd Quarter 2009 Data

The following general comments about the data for this quarter are made by THCIC and apply to all data released for this quarter.

- Data are administrative data, collected for billing purposes, not clinical data.
- Data are submitted in a standard government format, the 837 format used for submitting billing data to payers. State specifications require the submission of additional data elements. These data elements include race and ethnicity. Because these data elements are not sent to payers and may not be part of the hospital's standard data collection process, there may be an increase in the error rate for these elements. Data users should not conclude that billing data sent to payers is inaccurate.
- Hospitals are required to submit the patient's race and ethnicity following categories used by the U. S. Bureau of the Census. This information may be collected subjectively and may not be accurate.
- Hospitals are required to submit data within 60 days after the close of a calendar quarter (hospital data submission vendor deadlines may be sooner). Depending on hospitals' collection and billing cycles, not all discharges may have been billed or reported. Therefore, data for each quarter may not be complete. This can affect the accuracy of source of payment data, particularly self-pay and charity categories, where patients may later qualify for Medicaid or other payment sources.
- The Source of Admission data element is suppressed if the Type of Admission field indicates the patient is newborn. The condition of the newborn can be determined from the diagnosis codes. Source of admission for newborns is suppressed indefinitely.
- Conclusions drawn from the data are subject to errors caused by the inability of the hospital to communicate complete data due to reporting form constraints, subjectivity in the assignment of codes, system mapping, and normal clerical error. The data are submitted by hospitals as their best effort to meet statutory requirements.

QUARTER: 2
YEAR: 2009

Certified With Comments

Due to the system limitations, note that this is just an estimate and relates to identified source of funds, rather than actual collections from the identified source of funds.

Admission Type = Because of system constraints, all admissions on the encounter records are reported as urgent. The data report also includes emergency admissions.

Admission Source = Because of system constraints, all admissions sources on the encounter records are reported as court/law enforcement. The data reported also includes voluntary admissions. The Local Mental Health Authority refers the majority of admissions.

Patient Discharge Status = All patients, when discharged, are referred to the
Local Mental Health Authority.

Standard Source of Payment = Because of system constraints, all payment sources on the encounter records are reported as charity. The sources of payment, by percent, are:

</tbody>
</table>

Severity Index = All patients admitted have been determined to be a danger to self or others and the severity of illness is determined by an acuity assessment performed by the hospital. The severity Index on the encounter record for each patient is assigned based on the patient's APR-DRG (All-Patient Refined-Diagnosis Related Groups), which does not reflect the severity of mental illness due to reporting methodology.

The severity Index on the encounter record for each patient is assigned based on the patient's APR-DRG (All Patient Refined-Diagnosis Related Groups), which does not reflect the severity of mental illness due to reporting methodology.

Severity Index = All patients admitted have been determined to be a danger to self or others and the severity of illness is determined by an acuity assessment performed by the hospital. The severity Index on the encounter record for each patient is assigned based on the patient’s APR-DRG (All Patient Refined-Diagnosis Related Groups), which does not reflect the severity of mental illness due to reporting methodology.

Data Source The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as “charity” until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for St. Joseph Regional Health Center charity care, based on established rates for YTD Q2 2009 was $27,557,578.

Occurrence Date The occurrence date on last menstrual period is generally not a populated field within the hospital’s abstracting system. Accordingly this date for some patients has been estimated in this data set.

Patient Mix All statistics for St. Joseph Regional Health Center include patients from our Rehabilitation, and Acute Care populations. Our Rehabilitation units are long-term care units. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between St. Joseph Regional Health Center and any “acute care only” facilities.

Physicians All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment THCIC is using the 3M APR-DRG grouper to assign the
APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patient's diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper. Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

This data is submitted in an effort to meet statutory requirements. Conclusions
drawn could be erroneous due to communication difficulties in reporting complete data caused by reporting constraints, subjectivity in assignment of codes, various system mapping and normal clerical error. Data submission deadlines prevent inclusion of all applicable cases therefore this represents administrative claims data at the time of preset deadlines. Diagnostic and procedural data may be incomplete due to data field limitations. Data should be cautiously used to evaluate health care quality and compare outcomes.

THCIC ID: 041000
QUARTER: 2
YEAR: 2009
Certified With Comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as "charity" until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for Madison St. Joseph Health Center charity care, based on established rates for YTD Q2 2009 was $393,145.

Patient Mix - All statistics for Madison St. Joseph Health Center include patients from our Skilled Nursing, and Acute Care populations. Our Skilled Nursing unit is a long-term care unit. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Madison St. Joseph Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual costs.
reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and uncollectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patients age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patients diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper. Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

DATA Content
This data is administrative data, which hospitals collect for billing purposes, and not clinical data in medical records, from which you can make judgements about patient care.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called a UB92, in a standard government format called HCFA 1450 EDI electronic claim format.

Submission Timing
The hospital estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Diagnosis and Procedures
The data submitted matches the states reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the states data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of the patients hospitalization, sometimes significantly.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patients chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using
the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first nine diagnoses codes and the first six procedures codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes in an individual patients record may have been assigned. This means also that true total volumes may not be represented by the states data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious, therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Specialty Services
The data submitted does not have any specific data field to capture unit of service or expand in the specialty service (such as rehabilitation) provided to a patient. Services used by patients in rehabilitation may be very different from those used in other specialties. The data is limited in its ability to categorize patient type. Services utilized by patients in specialty units may be very different from those used in acute care. Conditions such as stroke and hip replacement typically require a lower level of care, a longer length of stay, and a different utilization of service.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay as long as or longer than 999 days, therefore, it is not anticipated that this limitation will affect this data. The hospital does have an inpatient rehabilitation unit whose patients stay an average of 12 days. This may skew the data when combined with other acute care patient stays.

Normal Newborns
The best way to focus on severity of illness regarding an infant would be to check the infants diagnosis at discharge, not the admitting source code. The hospitals normal hospital registration process defaults normal delivery as the admission source. Other options are premature delivery, sick baby, extramural birth, or information not available. The actual experience of a newborn is captured elsewhere in the file, namely, in the ICD-9-CM diagnosis. Admission source does not give an accurate picture.

Race/Ethnicity
During the hospitals registration process, the registration clerk does routinely complete patients race and/or ethnicity field. The race data element is sometimes subjectively captured and the ethnicity data element is derived from the race designation. There are no national standards regarding patient race categorization, and thus each hospital may designate a patients race differently. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the states race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.
Cost/Revenue
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges. Charges also do not reflect the actual costs to deliver the care that each patient needs.

Quality
Trending of data over a few years is important to define outcome and quality. A small sampling of data (i.e. one year) does not explain outcome. We recommend the Patient communicate with the Hospital and the Physician regarding data.
Patient and physician preference contributes to the care rendered to the patient and the data does not always reflect this. Patients and physicians consider many factors when making health care decisions that are not available in administrative data. These include a patient's preference for life-sustaining treatments, functional status, and other factors. We support the Patient, Provider, and Payer and empowered, educated decision-making. Quality improvement is not new; it is an ongoing commitment.

The following comments reflect concerns, errors, or limitations of discharge data for THCIC mandatory reporting requirements as of March 23, 2010. If any errors are discovered in our data after this point we will be unable to communicate these due to THCIC. This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgments about patient care.

Submission Timing
The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters no billed by this cut-off date will not be included in the quarterly submission file sent in.

Diagnosis and procedures
The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed which can alter the true picture of a patient's hospitalization, sometimes significantly.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

There is no mechanism provided in the reporting process to factor in DNR (Do Not Resuscitate) patients. Any mortalities occurring to a DNR patient...
are not recognized separately; therefore mortality ratios may be accurate for reporting standards but overstated.

While the hospital documents many treating physicians for each case, the THCIC minimum data set has only (2) physician fields, Attending and Operating Physicians. Many physicians provide care to patients throughout a hospital stay. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Analysis of "Other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

The data reports for Quarter 2, 2009 do not accurately reflect patient volume or severity.

Patient Volume
Data reflects administrative claims data (Uniform Billing data elements) that are a snapshot of claims one month following quarter-end. If the encounter has not yet been billed, data will not be reflected in this quarter.

Severity
Not all clinically significant conditions, such as the heart's ejection fraction, can be captured and reflected in the various billing data elements including the ICD-9-CM diagnosis coding system. As a result, the true clinical picture of the patient population cannot be adequately demonstrated using admissions and billing data.

DATA CONTENT
This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgements about patient care. The data submitted are certified to be accurate representations of the billing data recorded, to the best of our knowledge. The data is not certified to represent the complete set of data available on all inpatients but rather that...
Hospital Comments, 2Q2009.txt

data which was reported to a particular payer as required by that payer.

PHYSICIAN REVIEW OF THE DATA
Physicians admitting inpatients to Charlton, from time to time, review physician specific data that is generated from our internal computer systems. Medical Center did not attempt to have every physician individually review each patient in the actual data set returned to us by the State. We matched the State generated reports to internally generated reports to ensure data submission accuracy. We then reviewed these reports with Physician leadership who assisted us in generating the comments contained herein.

SUBMISSION TIMING
The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission. Claims billed in the subsequent quarter for discharges of a previous quarter will be submitted to the State in the subsequent quarters submission.

It should also be noted that the payer might deny all or part of a bill for which an adjustment might be made on our internal data systems. The process of appealing a denied claim or service and coming to final resolution can take as long as a year to resolve with a payer. Obviously any outcome of these processes would not be reflected in a quarters data.

OMISSION OF OBSERVATION PATIENTS
The reported data only include inpatient status cases. For various conditions, such as chest pain, there are observation patients that are treated effectively in a short non-inpatient stay and are never admitted into an inpatient status. The ratio for Charlton Methodist Hospital is about 1 observation patient for every 10 inpatients. Thus, calculations of inpatient volumes and length of stay may not include all patients treated in our hospital.

DIAGNOSIS AND PROCEDURES
The state and billing regulations require us to submit diagnoses and procedures in ICD-9-CM standard codes. The hospital can code up to 25 diagnosis codes and 25 procedure codes. The state data submission requirements limit us to the first nine diagnosis codes and the first six procedure codes. As a result, the data sent by us do meet state requirements but may not reflect all the codes an individual patient’s record may have been assigned. Approximately 13% of Charlton Methodist Hospitals patient population have more than nine diagnoses and/or six procedures assigned.

Therefore, those patients with multiple diseases and conditions (more diagnoses and procedures)
are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected. Further, true total volumes for a diagnosis or procedure may not be represented by the States data file, which therefore make percentage calculations such as mortality rates or severity of illness adjustments inaccurate.

Charlton Methodist Hospital adheres to national coding standards but it should be noted that coding cannot establish cause and effect (i.e. Infection coded, but does not identify whether present upon admission or developed in-house; fall coded, but does not identify whether the fall occurred prior to or during hospitalizations.). It is also difficult to distinguish between a co-morbidity and a complication.

NORMAL NEWBORNS
Admission Source or Admission Type codes are not the best way to reflect the pre-maturity or illness of an infant. Per State data submission regulation, if Admission Type is coded as a newborn then Admit Source is a code used to delineate the type of birth as normal newborn premature delivery sick baby and extra-mural birth. Admission type is a code used to classify a baby as a newborn only if the baby was actually born in the reporting hospital. A very sick baby, transferred from another hospital or facility will be coded as an Admission Type of Emergency and Admission Source of Xfer from Hospital. The actual conditions and experiences of an infant in our facility are captured elsewhere in the data file, namely, in the ICD-9-CM diagnoses and procedures codes.

RACE AND ETHNICITY CODES
We are concerned about the accuracy of the State mandated race and ethnicity codes. Some patients decline to answer our inquiries about their race or ethnic classification.
We certify that the race and ethnicity codes we submit represent nothing more than the patients own classification or our best judgment.

STANDARD/NON-STANDARD SOURCE OF PAYMENT
The standard and non-standard source of payment codes are an example of data required by the State that is not contained within the standard UB92 billing record. In order to meet this requirement each payers identification must be categorized into the appropriate standard and non-standard source of payment value. It is important to note that sometimes, many months after billing and THCIC data submission, a provider may be informed of a retroactive change in a patients eligibility for a particular payer. This will cause the Source of Payment data to be inaccurate as reported in the quarters snapshot of the data. The categories most effected are...
REVENUE CODE AND CHARGE DATA
The charge data submitted by revenue code represents Methodists charge structure, which may or may not be the same for a particular procedure or supply as another provider.

CAUTION ON THE USE OF DATA WITH SMALL NUMBERS OF CASES IN PERCENTAGE COMPARISONS
Besides the data limitations mentioned above, the number of cases that aggregate into a particular diagnosis, procedure or Diagnosis Related Grouping could render percentage calculations statistically non-significant if the number of cases is too small.

SEVERITY ADJUSTMENT SCORES
THCIC is responsible for providing and maintaining a tool to assign an All-patient Refined (APR) Diagnosis Related Group (DRG) severity score for each encounter at their data processing center. Charlton Methodist Hospital neither creates nor submits the APR DRG contained in the data sets.

PHYSICIAN UPIN NUMBER ERRORS
All physician UPIN numbers and names have been validated with the physician and the UPIN web-site as accurate even though some remain unidentified in the THCIC data tables. This appears to be due to delays in updating the THCIC UPIN data tables.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99
Hospital Comments, 2Q2009.txt
diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e., mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health HEB recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual...
Hospital Comments, 2Q2009.txt

cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the
patient’s blood hemoglobin level falls below 9.5, another physician may not
diagnose the patient with anemia until their blood hemoglobin level is below
9.0. In both situations, a diagnosis of anemia is correctly assigned, but the
criteria used by the physician to determine that diagnosis was different. An
apples to apples comparison cannot be made, which makes it difficult to obtain
an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the
patient’s admission to the hospital and those occurring during hospitalization.
For example, if a code indicating an infection is made, it is not always
possible to determine if the patient had an infection prior to admission, or
developed an infection during their hospitalization. This makes it difficult to
obtain accurate information regarding things such as complication rates.

The data submitted matches the state’s reporting requirements but may be
incomplete due to a limitation on the number of diagnoses and procedures the
state allows us to include for each patient. In other words, the state’s data
file may not fully represent all diagnoses treated by the hospital or all
procedures performed, which can alter the true picture of a patient’s
hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are
used by hospitals for billing purposes. The hospital can code up to 99
diagnoses and 99 procedures for each patient record. The state is requiring us
to submit ICD-9-CM data on each patient but has limited the number of diagnoses
and procedures to the first 25 diagnoses codes and the first 25 procedure codes.
As a result, the data sent by us does meet state requirements but cannot reflect
all the codes an individual patient’s record may have been assigned. This means
also that true total volumes may not be represented by the state’s data file,
which therefore make percentage calculations inaccurate (i.e. mortality
percentages for any given diagnosis or procedure, percentage of patients in each
severity of illness category). It would be obvious; therefore, those sicker
patients (more diagnoses and procedures) are less accurately reflected by the
837 format. It then stands to reason that hospitals, which treat sicker
patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the state’s certification file is
only three characters long. Thus any patients discharged with a length of stay
greater than 999 days will not be accurately stored within the certification
database. It is rare that patients stay longer than 999 days, therefore, it is
not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate
whether the baby was a normal newborn, premature delivery, sick baby, extramural
birth, or information not available. The best way to focus on severity of
illness regarding an infant would be to check the infant’s diagnosis at
discharge, not the admitting source code. Many hospital information systems and
registration process defaults to normal delivery as the admission source.
Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal
neonates using the admit source to identify the cases, the data will reflect
premature and sick babies mixed in with the normal newborn data. Texas Health
Fort Worth recommends use of ICD9 coding data to identify neonates. This
methodology will ensure correct identification of the clinical status of the
newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be
creating guidelines for use by hospitals. These guidelines will provide better
clarity for the accurate collection of this data. Hospitals do not routinely
collect race and ethnicity as part of the admission process, that this has been
added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

**Standard/Non-Standard Source of Payment**
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

**Cost/Revenue Codes**
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

**Discharge Disposition**
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

DATA CONTENT
This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgements about patient care. The data submitted are certified to be accurate representations of the billing data recorded, to the best of our knowledge. The data is not certified to represent the complete set of data available.
Physicians admitting inpatients to Methodist, from time to time, review physician specific data that is generated from our internal computer systems. Medical Center did not attempt to have every physician individually review each patient in the actual data set returned to us by the State. We matched the State generated reports to internally generated reports to ensure data submission accuracy. We then reviewed these reports with Physician leadership who assisted us in generating the comments contained herein.

Submit Timing
The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission. Claims billed in the subsequent quarter for discharges of a previous quarter will be submitted to the State in the subsequent quarters submission.

It should also be noted that the payer might deny all or part of a bill for which an adjustment might be made on our internal data systems. The process of appealing a denied claim or service and coming to final resolution can take as long as a year to resolve with a payer. Obviously any outcome of these processes would not be reflected in a quarters data.

Omission of Observation Patients
The reported data only include inpatient status cases. For various conditions, such as chest pain, there are observation patients that are treated effectively in a short non-inpatient stay and are never admitted into an inpatient status. The ratio for Methodist Medical Center is about 1.73 observation patients for every 10 inpatients. Thus, calculations of inpatient volumes and length of stay may not include all patients treated in our hospital.

Diagnosis and Procedures
The state and billing regulations require us to submit diagnoses and procedures in ICD-9-CM standard codes. The hospital can code up to 25 diagnosis codes and 25 procedure codes. The state data submission requirements limit us to the first nine diagnosis codes and the first six procedure codes. As a result, the data sent by us do meet state requirements but may not reflect all the codes an individual patients record may have been assigned. Approximately 20% of Methodist Medical Centers patient population have more than nine diagnoses and/or six procedures assigned.

Therefore, those patients with multiple diseases and conditions (more
Hospital Comments, 2Q2009.txt

diagnoses and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected. Further, true total volumes for a diagnosis or procedure may not be represented by the States data file, which therefore make percentage calculations such as mortality rates or severity of illness adjustments inaccurate.

Methodist Medical Center adheres to national coding standards but it should be noted that coding cannot establish cause and effect (i.e. Infection coded, but does not identify whether present upon admission or developed in-house; fall coded, but does not identify whether the fall occurred prior to or during hospitalizations.). It is also difficult to distinguish between a co-morbidity and a complication.

NORMAL NEWBORNS

Admission Source or Admission Type codes are not the best way to reflect the prematurity or illness of an infant. Per State data submission regulation, if Admission Type is coded as a newborn then Admit Source is a code used to delineate the type of birth as normal newborn premature delivery sick baby and extra-mural birth. Admission type is a code used to classify a baby as a newborn only if the baby was actually born in the reporting hospital. A very sick baby, transferred from another hospital or facility will be coded as an Admission Type of Emergency and Admission Source of Xfer from Hospital. Methodist Medical Center operates a level 3 critical care nursery, which receives transfers from other facilities. The actual conditions and experiences of an infant in our facility are captured elsewhere in the data file, namely, in the ICD-9-CM diagnoses and procedures codes.

RACE AND ETHNICITY CODES

We are concerned about the accuracy of the State mandated race and ethnicity codes. Some patients decline to answer our inquiries about their race or ethnic classification. We certify that the race and ethnicity codes we submit represent nothing more than the patients own classification or our best judgment.

STANDARD/NON-STANDARD SOURCE OF PAYMENT

The standard and non-standard source of payment codes are an example of data required by the State that is not contained within the standard UB92 billing record. In order to meet this requirement each payers identification must be categorized into the appropriate standard and non-standard source of payment value. It is important to note that sometimes, many months after billing and THCIC data submission, a provider may be informed of a retroactive change in a patients eligibility for a particular payer. This will cause the Source
REVENUE CODE AND CHARGE DATA
The charge data submitted by revenue code represents Methodist's charge structure, which may or may not be the same for a particular procedure or supply as another provider.

CAUTION ON THE USE OF DATA WITH SMALL NUMBERS OF CASES IN PERCENTAGE COMPARISONS
Besides the data limitations mentioned above, the number of cases that aggregate into a particular diagnosis, procedure or Diagnosis Related Grouping could render percentage calculations statistically non-significant if the number of cases is too small.

SEVERITY ADJUSTMENT SCORES
THCIC is responsible for providing and maintaining a tool to assign an All-patient Refined (APR) Diagnosis Related Group (DRG) severity score for each encounter at their data processing center. Methodist Medical Center neither creates nor submits the APR DRG contained in the data sets.

PHYSICIAN UPIN NUMBER ERRORS
All physician UPIN numbers and names have been validated with the physician and the UPIN web-site as accurate even though some remain unidentified in the THCIC data tables. This appears to be due to delays in updating the THCIC UPIN data tables.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Stephenville recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.
Race/Ethnicity
As of December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

=================================================================
PROVIDER: The University Medical Center of El Paso
THCIC ID: 263000
QUARTER: 2
YEAR: 2009
Certified With Comments
In this database only one primary physician is allowed. This represents the physician at discharge in this institution. At an academic medical center such as University Medical Center of El Paso, patients are cared for by teams of physicians who rotate at varying intervals. Therefore, many patients, particularly long term patients may actually be managed by several different teams. The practice of attributing patient outcomes in the database to a single physician may result in inaccurate information.

Mapping for the payer source indicates differences. In the THCIC information, Charity appears to be included in the self pay lines and the commercial insurances are itemized separately. The newborn data is being reported as Born in Hospital and Born outside Hospital which includes our well, premature and sick babies.

Through our Performance Improvement process, we review the data and strive to make changes to result in improvement.
Submission Timing
Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity
There are no national standards regarding patient race categorization
so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 16% of the primary payers originally categorized as Medicaid were recategorized as Managed Care. And approximately 10% of the secondary payers originally as Missing/Invalid were recategorized as Self-Pay. Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Cleburne recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information,
because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

============================================================================================================
PROVIDER: Baylor University Medical Center
THCIC ID: 331000
QUARTER: 2
YEAR: 2009
Certified With Comments

Submission Timing
Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other physician case volumes, mortality, case costs and LOS will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into
consideration that a significant portion of treating physicians are excluded from the patient cases.

**Diagnosis and Procedures**

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

**Normal Newborns**

The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. The actual experience of a newborn is captured elsewhere in the file, namely, in the ICD-9-CM diagnosis. Admission source does not give an accurate picture.

**Mortalities**

Due to insurance payer requirements, organ donor patients are readmitted and expired in the system to address the issues of separate payers. This results in double counting some "expired" cases which will increase the mortality figure reported and not accurately reflect the actual number of mortalities.

**Race/Ethnicity**

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

"Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

**Standard Source of Payment**

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review, approximately 7% of the primary payers originally categorized as Medicaid were recategorized as Managed Care. Approximately 12% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Self-Pay".

Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

**Cost/Revenue Codes**

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies.
Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

=================================================================
PROVIDER: Cook Childrens Medical Center
THCIC ID: 332000
QUARTER: 2
YEAR: 2009
Certified With Comments
Cook Children's Medical Center has submitted and certified second quarter 2009 discharge encounters to the Texas Health Care Information Council with the following possible data concerns based on the required submission method.

Since our data was submitted to the State we have uncovered medical coding errors regarding the following patient conditions:

Post-operative infections
Accidental puncture and lacerations
Post-operative wound dehiscence
Post-operative hemorrhage and hematoma
Comparative complication reports reflecting the above conditions could misstate the true conditions at Cook Children's Medical Center for the second quarter of 2009.

Patient charges that were accrued before admit or after discharge were systematically excluded from the database. This can happen when a patient is pre-admitted and incurs charges to their encounter before their admit date or charges are discovered and added to the patient encounter after they are discharged. Therefore, the charges for many patient encounters are under reported.

The data structure allowed by THCIC erroneously assigns surgeons to surgical procedures they did not perform. The data structure provided by THCIC allows for one attending and one operating physician assignment. However, patients frequently undergo multiple surgeries where different physicians perform multiple procedures. Assigning all of those procedures to a single 'operating physician' will frequently attribute surgeries to the wrong physician. THCIC chooses to only assign one surgeon to a patient encounter, not to each procedure.

Furthermore, the data structure established by THCIC allows for a limited number of diagnoses and procedures. Patients with more than the limit for diagnoses or procedures will be missing information from the database. This is especially true in complex cases where a patient has multiple major illnesses and multiple surgeries over an extended stay.

Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. “Other” physician case volumes, mortality, case costs and LOS will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of “other physician” information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation
of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Medical Record Number
Due to a new system implementation, the Medical Record format was changed from alphanumeric to numeric. Starting 4QTR2004 forward, the leading digit of M was dropped leaving the remaining number as the Medical Record number. This change in format will need to be considered when calculating any readmission rates or the rates will be erroneously lower.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review, approximately 8% of the primary payers originally categorized as Medicaid were reclassified as Managed Care. Also, approximately 11% of the secondary payers originally categorized as Missing/Invalid were reclassified as Self-Pay.

Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. PROVIDER: Medical Center-Lewisville
THCIC ID: 394000
QUARTER: 2
YEAR: 2009
Certified With Comments

When reviewing the data for the Medical Center of Lewisville, please consider the following:

The data is administrative/claims data, not clinical research data. There may be inherent limitations to using it to compare outcomes.

The cost of care, charges, and the revenue a facility receives is extremely complex. Inferences to comparing costs costs of care from one hospital to another to another may result in unreliable results.

Admission source data is not collected and grouped at the Medical Center of Lewisville in the same manner as displayed.

Under the Standard Source of Payment, please note that statistics in the “Commercial” category also includes managed care providers.

The severity grouping assignment performed by the state using the APR-DRG
Introduction

John Peter Smith Hospital (JPSH) is operated by the JPS Health Network under the auspices of the Tarrant County Hospital District. The JPS Health Network is accredited by the Joint Commission. In addition, JPSH holds Joint Commission accreditation as a hospital.

JPSH was the first Texas Department of Health certified Level II Trauma Center in Tarrant County and includes the only 24-hour, seven-day a week psychiatric emergency center in the area. The hospital's special services include intensive care for adults and newborns, a special AIDS treatment center, a skilled nursing unit, a full-range of obstetrical and gynecological services, inpatient care for patients of all ages and an inpatient mental health treatment facility.

JPSH is a major teaching hospital offering or providing through co-operative arrangements post-doctoral training in family medicine, orthopedics, obstetrics and gynecology, psychiatry, surgery, oral and maxillofacial surgery, radiology, sports medicine and podiatry.

In addition to JPSH, the JPS Health Network operates community-based health centers located in medically underserved areas of Tarrant County, school-based health centers, special outpatient programs for pregnant women and a wide range of wellness education programs.

Data Comments

This inpatient data was submitted to meet requirements of the State of Texas for reporting second quarter 2009 inpatient hospital discharge data. The data used by the Texas Health Care Information Collection (THCIC) is administrative and collected for billing purposes, and it should be noted that the data is a "snapshot" at the time of the file production and not of the final disposition of claim data to the payor. It is not clinical data and should be cautiously used to evaluate health care quality. Also, the use of only one quarter's data to infer statistical meaning can lead to misinterpretation.

Charges

Because of changes in payor categories, information about insurance or patient type may not be accurate. Specifically, charity care may not be accurately reflected in the new reporting categories.

Maximum Charge Calculation

There is an inherent limitation in our Siemens billing system. At the point during a specific patient stay that the system's maximum number of entries is reached, a certain number of defined charges are captured at a summary level and then deleted from the system to make room for additional charges. At JPS, this would impact the charges for a very limited number of patients for whom we will attempt a manual adjustment. Because of this deficiency, charge information may be understated.

Physician Master File

A patient may have several attending physicians throughout his/her course of stay due to the rotation of physicians to accommodate teaching responsibilities.
Length of Stay
Some of our patients require increased length of stay. Reasons for increased length of stay are:

"JPSH is a major trauma center, many patients have suffered multiple system trauma.
"JPSH operates a SNF (skilled nursing facility) unit.
"JPSH operates a Level III neonatal intensive care unit which has an impact on overall length-of-stay.
"JPSH operates an inpatient psychiatric unit in which many patients are court-committed and length of stay is determined by the legal system.
"Diagnosis of cancer has increased significantly and a large number of our patients do not have resources to access hospice and/or palliative care, thereby impacting length of stay.
"Many of our patients have limited financial resources making it impossible for them to secure intermediate care. This, in turn, often limits their discharge options and they remain at JPSH longer than would otherwise be the case.

We are certifying the State data file, with comments.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the
hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, that sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Arlington Memorial Hospital recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.
Hospital Comments, 2Q2009.txt

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Dallas recommends use of ICD-9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.
Race/Ethnicity
As of December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

PROVIDER: Texas Health Presbyterian Hospital - Winnsboro
THCIC ID: 446000
QUARTER: 2
YEAR: 2009

Certified With Comments
Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.
Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis.

For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Winnsboro recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the
newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO, are categorized as Commercial PPO. Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician’s subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient’s blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient’s admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state’s reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state’s data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient’s hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient’s record may have been assigned. This means also that true total volumes may not be represented by the state’s data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, that those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.
Length of Stay

The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Azle recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.
Parkland Health & Hospital System comprises a network of neighborhood-based health centers and Parkland Memorial Hospital, which was established in 1894. The Parkland System is a $995 million enterprise that is licensed for 968 beds and employs approximately 8,300 staff. 13,302 patients received inpatient care this quarter. The hospital delivered over 14,900 babies during the 12 month period ending June 2009.

Specific Data Concerns

1. As in other large academic medical centers, teams of physicians rotating at intervals care for patients. The THCIC dataset allows only one primary physician to be assigned to the patient for the entire inpatient stay. In our institution, this represents the physician caring for the patient at the time of discharge. Many patients, particularly long-term care patients are actually managed by as many as three to four different teams and attending physicians. For this reason, the practice of attributing patient outcomes to the report card of a single physician may result in misleading information.

2. Parkland Hospital transitioned to a new system-wide registration and accounting information system in September, 2005. In this transition, updates to several clinical information systems were also accomplished, with improved integration of patient clinical and administrative data. PHHS transitioned to elements of an electronic medical record system in April 2009.

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide
Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs, and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 15% of the primary payers originally categorized as Other were recategorized as Managed Care. And approximately 11% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Self-Pay". Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.
Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

Submission Timing

Baylor Specialty Hospital (BSH) estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.
Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentifed in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
BSH is different from most hospitals submitting data to the state. We provide complex medical services to patients who have experienced a catastrophic illness and/or complex body system failure that requires coordinated, intensive treatment and care. Many of the patients have received emergency care and stabilizing treatment at another acute care hospital. They are admitted to BSH to continue their recovery and focus on improving their medical condition and/or functional ability in order to improve their quality of life to the fullest extent possible.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at BSH are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all long term acute care hospitals is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.
Hospital Comments, 2Q2009.txt

Length of Stay
Medical recovery at BSH can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of medically complex patients, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Admission Source
The majority of entries for Admission Source were coded incorrectly (erroneously reflecting that our main source of admission was Physician Referral). The majority of admission sources are Transfer from Hospital. This was due to a procedural error which has now been corrected.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the states race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital. "Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patients encounter record might change over time.

With this in mind, approximately 6% of the secondary payers originally categorized as Medicaid were recategorized as Managed Care.

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

Submitted By: Edica E. Berry, Director, Quality Outcomes

- Inpatient discharge data have been collected from claims data. The data are used for billing purposes and are not clinical data. Due to the diversity of healthcare organizations and data collecting practices throughout Texas, there are inherent limitations on comparing outcomes.
- The public data file does not contain all the diagnosis and procedure codes. It contains only 9 diagnosis codes and 6 procedure codes per encounter. This will affect the volume of procedures, the severity adjustment and mortality rates.
- The data reflect only those patients admitted to a hospital during the year and are aggregated, not trended. Data over time are needed for a more accurate assessment of the health care facilities performance.
- THCIC has excluded data when five or fewer patients had a procedure and did not perform statistical analysis when there were fewer than 30 patients.
- Race/Ethnicity classification is not done systematically within or between facilities. Caution should be used when analyzing this data within one facility and between facilities.

General Comments:

- Round Rock Medical Center is a member of the St. Davids Healthcare Partnership and supports the effort of the THCIC to provide publicly released hospital data as an integral part of our ongoing organizational quality improvement process. We have been tracking similar data and developing improvement measures as applicable over the past few years.
- Although the risk-adjusting software helps in making the data more comparable among facilities, it too is an approximation that may not truly represent the mix of patients. This is particularly true for mortalities in patients admitted for terminal care. Terminal care has a very high expected mortality, and this is not accounted for in the methodology.
- Since medical mortalities are relatively infrequent events and occur at
irregular intervals, the data can and do vary considerably over time. We have noticed considerable fluctuation and variation in all of our facilities over the past three years, depending upon the time period that the data were measured.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician’s subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient’s blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient’s admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state’s reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state’s data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient’s hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses
Hospital Comments, 2Q2009.txt

and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Southwest recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Additionally, there continues to be mapping issues between the State's source of payment values and that used by Texas Health Resources (THR) and Harris Methodist Southwest Hospital (HMSW). In March 2006, the State requested a change in assignment of source of payment values and THR/HMSW complied with that request. However, the State has not yet converted to this new mapping criteria thus causing a discrepancy in the data generated for THSW's payers. We have been assured that by the 3rd Quarter 2006 Certification time period, the State's source of payment values will be updated and there will no longer be this...
Hospital Comments, 2Q2009.txt

discrepancy.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Submission Timing
Baylor Institute for Rehabilitation (BIR) estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in. BIR has a 10-day billing cycle; therefore we will have a higher percentage of incomplete encounters than hospitals with a 30-day billing cycle.

Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Hospital Comments, 2Q2009.txt

BIR is different from most hospitals submitting data to the state. We provide comprehensive medical rehabilitation services to patients who have lost physical or mental functioning as a result of illness or injury. Many of these patients have already received emergency care and stabilizing treatment at an acute care hospital. They are admitted to BIR to continue their recovery and focus on improving their functional ability in order to improve their quality of life to the fullest extent possible.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at BIR are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all comprehensive medical rehabilitation facilities is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay
Medical rehabilitation at BIR can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of rehabilitation services, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project, but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identification must be categorized into the appropriate standard source of payment value. With this in mind, approximately 8% of the secondary payers originally categorized as Missing/Invalid were recategorized as Self-Pay.

Additionally, those payers identified contractually as both “HMO and PPO” are categorized as “Commercial PPO”. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to
Hospital Comments, 2Q2009.txt

managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all patients.
Hospital Comments, 2Q2009.txt

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days; therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
Texas Health Specialty Hospital does not have a newborn population.

Admit Type
In October 2008 Harris Methodist Continued Care transitioned to a new ADT system. With this transition, there were issues with the admit type for five patients (all of the admissions for Harris Methodist Continued Care are elective). These issues could not be corrected before the data was submitted. There is a plan in place to correct this issue for future submissions.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis.

For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization.

Page 67
For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state’s reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state’s data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient’s hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient’s record may have been assigned. This means also that true total volumes may not be represented by the state’s data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Plano recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data
required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as “charity” until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgiven for Burleson St. Joseph Health Center

Page 69
charity care, based on established rates for YTD Q2 2009 was $331,504.

**Patient Mix** - All statistics for Burleson St. Joseph Health Center include patients from our Skilled Nursing and Acute Care populations. Our Skilled Nursing unit is a long-term care unit. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Burleson St. Joseph Health Center and any "acute care only" facilities.

**Physicians** - All physician license numbers and names have been validated as accurate but some remain unidentified in the THIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

**Diagnosis and Procedures** - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

**Cost and Charges** - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

**Severity Adjustment** - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patients age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patients diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper. Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

Submission Timing
Our Childrens House at Baylor (OCH) estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
OCH is different from most hospitals submitting data to the state. We provide complex medical services to patients who have experienced a catastrophic illness, congenital anomalies and/or complex body system failure that requires coordinated, intensive treatment and care. Many of the patients have received emergency care and stabilizing treatment at another acute care hospital or another childrens acute care hospital. They are admitted to OCH to continue their recovery and focus on improving their medical condition.
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at OCH are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all Childrens hospitals is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay
Medical recovery at OCH can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of medically complex patients, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Admission Source
The majority of entries for Admission Source were coded incorrectly (erroneously reflecting that our main source of admission was Physician Referral). The majority of admission sources are Transfer from Hospital. This was due to a procedural error which has now been corrected.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital. "Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard and non-standard source of payment value. It should also be noted that the primary payer associated to the patients encounter record might change over time. Upon review, Approximately 24% of secondary payors categorized as "Medicaid" were recategorized as "Managed Care". Also approximately 4% of the secondary payors originally categorized as Missing Invalid were recategorized as Self-Pay.

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual revenue.
payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

We are a Long Term Care Hospital so we have a much greater average length of stay. In addition, our hospital averages a higher CMI (acuity index) which does result in a higher mortality rate than short term acute care hospitals. Correction to secondary payer information to follow.
Hospital Comments, 2Q2009.txt

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient’s admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient’s record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality
percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category. It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Seay Behavioral Center recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital’s payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

PROVIDER: Grimes St Joseph Health Center
THCIC ID: 728800
QUARTER: 2
YEAR: 2009

Certified With Comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as “charity” until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for Grimes St. Joseph Health Center charity care, based on established rates for YTD Q2 2009 was $288,270.

Patient Mix - Grimes St. Joseph Health Center is a Critical Access Hospital. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Grimes St. Joseph Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCI C is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patients age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patients diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCI C. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper. Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data

Page 81
file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient’s record may have been assigned. This means also that true total volumes may not be represented by the state’s data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay
The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Springwood recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospitals' payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.
Hospital Comments, 2Q2009.txt

Cost/Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

================================================================================

PROVIDER: Baylor Heart & Vascular Center
THCIC ID: 784400
QUARTER: 2
YEAR: 2009

Certified With Comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Hospital Comments, 2Q2009.txt

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review approximately 18% of the primary payers originally categorized as "Indemnity" were recategorized as "Managed Care". Also approximately 9% of the secondary payers originally categorized as "Indemnity" were recategorized as Managed Care, and 3% categorized as Missing/Invalid were recategorized as Self-Pay.

Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

Dubuis Hospital is a Long Term Acute Care Hospital. This designation of Long Term Acute separates Dubuis Hospital from Short Term Acute Hospitals in many aspects. Therefore relevant comparisons should be made with only other Long Term Acute Hospitals. Only acutely ill patients requiring an average length of stay of approximately 25 days are admitted to Dubuis Hospital per our designation as Long Term Acute. Therefore our length of stay is much longer than a regular Short Term Hospital. In addition, our patient mix is predominantly elderly as they most often have more serious illnesses with more frequent secondary problems. Subsequently they require a longer hospital stay than the younger population.

The data reports for Quarter 2, 2009 do not accurately reflect patient volume or severity. 

Patient Volume

Data reflects administrative claims data (Uniform Billing data elements) that are a snapshot of claims one month following quarter-end. If the encounter has not yet been billed, data will not be reflected in this quarter.

Severity

Not all clinically significant conditions, such as the heart's ejection fraction, can be captured and reflected in the various billing data elements including the ICD-9-CM diagnosis coding system. As a result, the true clinical picture of the patient population cannot be adequately demonstrated using admissions and billing data.

Submission Timing
Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification
All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentifiable in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresented.
Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures
Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International

Page 87
Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 14% of the secondary payers originally categorized as Missing/Invalid were recategorized as Indemnity and 4% originally categorized as Missing/Invalid were recategorized as Self-Pay.

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

================================================================================================================================================================
PROVIDER: Texas Health Presbyterian Hospital - Denton
THCIC ID: 820800
QUARTER: 2
YEAR: 2009

Certified With Comments

Data Content
This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

Page 88
The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is over and above the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government. The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician’s subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient’s blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An apples to apples comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient’s admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state’s reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state’s data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient’s hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient’s chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient’s record may have been assigned. This means also that true total volumes may not be represented by the state’s data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the states certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.
Hospital Comments, 2Q2009.txt

Admit Source data for Normal Newborn
When the Admit type is equal to newborn, the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant’s diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to normal delivery as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Texas Health Denton recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity
As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient’s admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment
The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both HMO, and PPO are categorized as Commercial PPO. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition
THR has identified a problem with a vendor (Siemens) extract that diverts some patient discharges to home as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

DATA CONTENT
This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgments about patient care. The data submitted are certified to be accurate representations of the billing data recorded, to the best of our knowledge. The data is not certified to represent the complete set of data available on all inpatients but rather that data which was reported to a particular payer as required by that payer.

PHYSICIAN REVIEW OF THE DATA
Physicians admitting inpatients to Methodist, from time to time, review physician specific data that is generated from our internal computer systems. Methodist Mansfield did not attempt to have every physician individually review each patient in the actual data set returned to us by the State. We matched the State generated reports to internally generated reports to ensure data submission accuracy. We then reviewed these reports with Physician leadership who assisted us in generating the comments contained herein.

SUBMISSION TIMING
The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission. Claims billed in the subsequent quarter for discharges of a previous quarter will be submitted to the State in the subsequent quarters submission.

It should also be noted that the payer might deny all or part of a bill for which an adjustment might be made on our internal data systems. The process of appealing a denied claim or service and coming to final resolution can take as long as a year to resolve with a payer. Obviously any outcome of these processes would not be reflected in a quarters data.

OMISSION OF OBSERVATION PATIENTS
The reported data only include inpatient status cases. For various conditions,
such as chest pain, there are observation patients that are treated effectively in a short non-inpatient stay and are never admitted into an inpatient status. The ratio for Methodist Mansfield is about 1.73 observation patients for every 10 inpatients. Thus, calculations of inpatient volumes and length of stay may not include all patients treated in our hospital.

DIAGNOSIS AND PROCEDURES
The state and billing regulations require us to submit diagnoses and procedures in ICD-9-CM standard codes. The hospital can code up to 25 diagnosis codes and 25 procedure codes. The state data submission requirements limit us to the first nine diagnosis codes and the first six procedure codes. As a result, the data sent by us do meet state requirements but may not reflect all the codes an individual patient’s record may have been assigned. Approximately 20% of Methodist Mansfield’s patient population have more than nine diagnoses and/or six procedures assigned.

Therefore, those patients with multiple diseases and conditions (more diagnoses and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected. Further, true total volumes for a diagnosis or procedure may not be represented by the state’s data file, which therefore make percentage calculations such as mortality rates or severity of illness adjustments inaccurate.

Methodist Mansfield Medical Center adheres to national coding standards but it should be noted that coding cannot establish cause and effect (i.e., infection coded, but does not identify whether present upon admission or developed in-house; fall coded, but does not identify whether the fall occurred prior to or during hospitalizations.). It is also difficult to distinguish between a co-morbidity and a complication.

NORMAL NEWBORNS
Admission Source or Admission Type codes are not the best way to reflect the prematurity or illness of an infant. Per state data submission regulation, if Admission Type is coded as a newborn then Admit Source is a code used to delineate the type of birth as normal newborn premature delivery sick baby and extra-mural birth. Admission type is a code used to classify a baby as a newborn only if the baby was actually born in the reporting hospital. A very sick baby, transferred from another hospital or facility will be coded as an Admission Type of Emergency and Admission Source of Xfer from Hospital. Methodist Mansfield Medical Center
operates a level 3 critical care nursery, which receives transfers from other facilities. The actual conditions and experiences of an infant in our facility are captured elsewhere in the data file, namely, in the ICD-9-CM diagnoses and procedures codes.

RACE AND ETHNICITY CODES
We are concerned about the accuracy of the State mandated race and ethnicity codes. Some patients decline to answer our inquiries about their race or ethnic classification. We certify that the race and ethnicity codes we submit represent nothing more than the patients own classification or our best judgment.

STANDARD/ NON-STANDARD SOURCE OF PAYMENT
The standard and non-standard source of payment codes are an example of data required by the State that is not contained within the standard UB92 billing record. In order to meet this requirement each payer's identification must be categorized into the appropriate standard and non-standard source of payment value. It is important to note that sometimes, many months after billing and THCIC data submission, a provider may be informed of a retroactive change in a patient's eligibility for a particular payer. This will cause the Source of Payment data to be inaccurate as reported in the quarters snapshot of the data. The categories most effected are Self Pay and Charity shifting to Medicaid eligible.

REVENUE CODE AND CHARGE DATA
The charge data submitted by revenue code represents Methodist's charge structure, which may or may not be the same for a particular procedure or supply as another provider.

CAUTION ON THE USE OF DATA WITH SMALL NUMBERS OF CASES IN PERCENTAGE COMPARISONS
Besides the data limitations mentioned above, the number of cases that aggregate into a particular diagnosis, procedure or Diagnosis Related Grouping could render percentage calculations statistically non-significant if the number of cases is too small.

SEVERITY ADJUSTMENT SCORES
THCIC is responsible for providing and maintaining a tool to assign an All-patient Refined (APR) Diagnosis Related Group (DRG) severity score for each encounter at their data processing center. Methodist Mansfield Medical Center neither creates nor submits the APR DRG contained in the data sets.

PHYSICIAN UPIN NUMBER ERRORS
All physician UPIN numbers and names have been validated with the physician and the UPIN web-site as accurate even though some remain unidentified in the THCIC data tables. This appears to be due to delays in updating the THCIC UPIN data tables.
Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresented. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as
many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity
There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment
The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review approximately 7% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as Self-Pay and 5% originally categorized as Indemnity were recategorized as Champus. Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes
The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process
Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

PROVIDER: Texoma Medical Center
THCIC ID: 847000
QUARTER: 2
YEAR: 2009

Certified With Comments

Data Source. The source of this data, the electronic bill, is administrative in nature, and was collected for billing purposes. It is not clinical data and should be cautiously used to evaluate health care quality.
* The billing data file limits the diagnosis codes to 25 (principal plus 24 secondary diagnosis codes); the admission diagnosis and up to nine E-code fields.
* The procedure codes are limited to 25 (principal plus 24 secondary).
* The fewer the codes the less information is available to evaluate the patient's outcomes and service utilization.
* The Hospital can only list 2 physicians that were involved with any one patient. Other physicians who were involved in those cases will not be identified.

Payer Codes. The payer codes utilized in the THCIC data base were defined by the state. They are not utilizing the standard payer information from the claim.

Revenue Codes and Charges. Charges associated with the 1450 data do not represent actual payments or costs for services.

Severity Adjustment. THCIC is using the 3M APR-DRG system to assign the All-Patient Refined (APR) DRG, severity and risk of mortality scores. The scores represent a categorization of patient severity and mortality risk. The assignment is made by evaluation of the patient’s age, sex, diagnosis codes, procedure codes, and discharge status.

Timing of Data Collection. Hospitals must submit data to THCIC no later than 60 days after the close of the quarter.
* Not all claims may have been billed at this time.
* Internal data may be updated later and appear different than the data on the claim. Unless the payment is impacted, the hospital does not re bill when a data field is changed internally. This results in differences between internal systems and the snapshot of data that was taken at the end of the quarter.
