2018/2019 Flu Season Update

Task Force on Infectious Disease Preparedness and Response

Dr. John Hellerstedt, Commissioner

October 3, 2018
Presentation Outline

• Influenza Overview
• 2017 – 2018 Flu Season Recap
• 2018 – 2019 Flu Season
  o Vaccinations Available
  o Antiviral Drugs Available
• DSHS Preparedness for Influenza Pandemics
Influenza Virus Overview

• Two main types of flu virus in humans:
  o Influenza A
    ▪ Causes seasonal epidemics and pandemics
    ▪ Subtypes include H1N1 and H3N2
  o Influenza B
    ▪ Causes seasonal epidemics
    ▪ Lineages include Yamagata and Victoria
Influenza Vaccine Overview

• Antibodies develop in the body ~2 weeks after vaccination
  o Provide protection against the viruses that are in the vaccine

• A flu vaccine is needed every season for two reasons:
  1. Flu viruses change over time and require updated vaccines
  2. Immune response from vaccination declines over time

• When a large percentage of the population is vaccinated, the spread of the disease is limited
  o This protects unimmunized individuals, including those who can’t be vaccinated, and those for whom vaccination was not successful
  o As the number of those vaccinated increases, the protective effect increases—herd immunity

• Decreases risk of pandemic strains evolving
Texas Flu Vaccination Coverage

Estimated Flu Vaccination Coverage in Texas, by Age Group, for the 2017 – 2018 Season (as of 9/21/18)

- Adults 65+ yrs: 59%
- Adults 18-64 yrs: 32%
- 13-17 yrs: 48%
- 5-12 yrs: 61%
- 6 mos-4 yrs: 65%

Percent Vaccinated
Reporting Influenza-Associated Conditions

• Individual cases of influenza are **not** reportable in Texas

• What is reportable:
  o Novel and variant influenza A cases in humans
  o Influenza-associated pediatric deaths
  o Respiratory, influenza, or influenza-like illness (ILI) outbreaks
    ▪ Influenza-like illness is characterized as a fever of 100°F or greater with a cough and/or a sore throat in the absence of another known cause
Percentage of Visits Due to Influenza-Like Illness Reported by Texas ILINet Participants, 2014–2018 Seasons

MMWR Reporting Week

Percentage of visits due to ILI

- 2014-2015
- 2015-2016
- 2016-2017
- 2017-2018

Number and Percentage of Tests (Antigen, Culture, PCR) Positive for Influenza by Type, Subtype, and Lineage Reported by Texas Public Health Laboratories, 2017-2018 Season
The number of reported outbreaks in Texas increased by 153% when compared to the last flu season:
- 105 in 2016-17 season
- 266 in 2017-18 season

Over 75% of the outbreaks were reported in long-term care facilities.
Texas Influenza-Associated Pediatric Mortality, 2017-2018 Season

- 16 influenza-associated pediatric deaths were reported in the 2017-2018 season as of September 12, 2018
  - > half of the children were positive for influenza A
  - 5 (31%) children had no underlying health conditions
    - 2016-17 season: 2 out of 8 (25%) had no underlying health conditions
  - 10 out of 11 (90.9%) of the children with known vaccination status were not vaccinated for influenza for the 2017-2018 season

2018-2019 Flu Season

• Flu is unpredictable
  o This flu season may be as severe as the last
• Recent Southern Hemisphere flu season has been relatively mild
  o H1N1 flu virus has predominated
  o May or may not be predictive of Northern Hemisphere season
• Increased flu vaccine options available
2018 – 2019 Seasonal Influenza Vaccine

• 2018-2019 Composition:
  - Trivalent vaccines will contain:
    ▪ A/Michigan/45/2015 (H1N1)pdm09–like virus
    ▪ A/Singapore/INFIMH-16-0019/2016 (H3N2)–like virus
    ▪ B/Colorado/06/2017–like virus (Victoria lineage)
  - Quadrivalent vaccines will contain:
    ▪ Same components as trivalent vaccine
    ▪ B/Phuket/3073/2013–like virus (Yamagata lineage)
Antivirals recommended for the 2018-2019 season:

- **Oseltamivir**—available as a generic version or under the trade name Tamiflu®:
  - Pill or liquid suspension FDA approved for early treatment of flu in people 14 days old and older

- **Zanamivir**—trade name Relenza®:
  - Powder that is inhaled and approved for early treatment of flu in people 7 years of age and older, not recommended for people with breathing problems like asthma or COPD

- **Peramivir**—trade name Rapivab®:
  - Given intravenously by a health care provider and is approved for early treatment of flu in people 2 years of age and older
DSHS Preparedness

• Constantly working to adapt and scale our everyday activities to disaster and pandemic situations:
  o 2009 H1N1 Pandemic:
    ▪ Distributed lots of vaccine and antivirals
    ▪ Difficulty with provision of medical care
  o Hurricane Harvey flooding:
    ▪ Distributed 70,633 vaccines
      • 7,690 doses of flu vaccine
    ▪ Responded to 3 flu outbreaks in shelters
    ▪ Difficulty with cold-chain management and vaccination of first responders
DSHS Pandemic Preparedness

• Staff dedicated to preparedness planning
• Ongoing efforts to:
  o Form partnerships across the state with pharmacies and others
  o Strengthen plans for cold chain management of vaccines
  o Establish receiving and distribution sites for National Strategic Stockpile shipments
  o Train public health officials and staff on effective response through table top exercises
