Outpatient/Ambulatory Health Services
Service Standard

**HRSA Definition:** Outpatient/Ambulatory Health Services (OAHS) are diagnostic and therapeutic services provided directly to a client by a licensed healthcare provider in an outpatient medical setting. Outpatient medical settings include clinics, medical offices, and mobile vans where clients do not stay overnight.

**Limitations:** Emergency room, urgent care services, or ambulance services are NOT considered outpatient settings; therefore, services cannot be reimbursed. (RWHAP Legislation, HRSA PCN 16-02)

**Services:** Allowable activities include:
- Medical history taking
- Physical examination
- Diagnostic testing, including laboratory testing
- Treatment and management of physical and behavioral health conditions
- Behavioral risk assessment, subsequent counseling, and referral
- Preventive care and screening
- Pediatric developmental assessment
- Prescription, and management of medication therapy
- Treatment adherence services *provided during an OAHS visit*
- Education and counseling on health and prevention issues
- Referral to and provision of specialty care related to HIV diagnosis

Care must include access to antiretroviral and other drug therapies, including prophylaxis and treatment of opportunistic infections and combination antiretroviral therapies (ART).

Diagnostic Laboratory Testing includes all indicated medical diagnostic testing, including all tests considered integral to treatment of HIV and related complications (e.g., viral Load, CD4 counts, and genotype assays). Funded tests must meet the following conditions:
- Tests must be consistent with medical and laboratory standards as established by scientific evidence and supported by professional panels, associations, or organizations;
- Tests must be (1) approved by the U.S. Food and Drug Administration (FDA), when required under the FDA Medical Devices Act; and/or (2) performed in an approved Clinical Laboratory Improvement Amendments of 1988 (CLIA)-certified laboratory or State-exempt laboratory; and
- Tests must be (1) ordered by a registered, certified, or licensed medical provider, and (2) necessary and appropriate based on established clinical practice standards and professional clinical judgment.

Telemedicine is an acceptable means of providing OAHS but must conform to the Texas Medical Board (TMB) guidelines for providing telemedicine, Texas Administrative Code, Texas Medical Board, Rules, Title 22, Part 9, Chapter 174, RULE §174.1 to §174.12 and the February 2018 Texas Medicaid Provider Telecommunication Services Handbook, Volume 2.
Service Standard and Performance Measure

The following Standards and Performance Measures are guides to improving clinical care throughout the State of Texas within the Ryan White Part B and State Services Program. The most current U.S. Department of Health and Human Services (HHS), Health Resources and Services Administration (HRSA), Guide for HIV/AIDS Clinical Care – 2014 Edition are sources cited throughout the Standards for additional reference materials for direct care service providers.

<table>
<thead>
<tr>
<th>Standard</th>
<th>HRSA: HAB Performance Measure</th>
</tr>
</thead>
</table>
| **Medical Evaluation/Assessment**<br>All HIV patients receiving medical care shall have a completed initial comprehensive medical evaluation/assessment and physical examination that adheres to the current HHS guidelines within one (1) month of HIV diagnosis or within 15 business days of initial contact with patient who has been in care. | Percentage of patients who attended a routine HIV medical care visit within one (1) month of HIV diagnosis. *(HRSA HAB Measure – Linkage to Care)*

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

| **Comprehensive HIV-related history**<br>Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines. | Percentage of existing patients (returning to care and those in current medical care for more than one year) with a documented comprehensive assessment/evaluation completed by the MD, NP, CNS, or PA within 15 business days of initial contact with patient in accordance with professional and established HIV practice guidelines.

History shall consist of, at a minimum, general medical history, a comprehensive HIV related history, and psychosocial history to include:

- Documented past medical and surgical history with regard to chronic diseases such as diabetes, high blood pressure, heart disease, cholesterol, asthma or emphysema, sickle cell disease, etc. per HHS guidelines.
- Psychosocial history to include socio-cultural assessment, occupational history, hobbies (as applicable), travel history, mental

| Percentage of new patients with a documented comprehensive HIV-related history that is inclusive of all components listed in the OAHS Standard as referenced in the HHS guidelines. | Percentage of existing patients with a documented comprehensive HIV-related history that is inclusive of all components listed in the OAHS Standard as referenced in the HHS guidelines.

---

health, and housing status.

- Lifestyle including tobacco use, alcohol use, illicit substance use, exercise, travel history.
- Sexual Health including partners, practices, past sexually transmitted infections (STIs), contraception use (past and present).
- HIV-related health history including most recent CD4 and Viral Load results, current ART (if applicable), previous adverse ART drug reactions, history of HIV-related illness and infections, HIV treatment history and staging.

Physical examination will include the documentation from the complete review of systems as indicated within the comprehensive medical history. This can be completed during the initial visit or divided over the course of two or three early visits.

<table>
<thead>
<tr>
<th>Physical examination</th>
<th>Percentage of new patients with a documented annual physical examination.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Providers should perform a baseline and annual comprehensive physical examination, with particular attention to areas potentially affected by HIV.</td>
<td>Percentage of new patients with a diagnosis of HIV who received an oral cavity exam during the physical exam as documented in the patient’s primary record.</td>
</tr>
<tr>
<td>Examination of the oral cavity should be included in both the initial and interim physical examination of all HIV patients.</td>
<td>Percentage of existing patients with a documented annual physical examination.</td>
</tr>
</tbody>
</table>
Initial laboratory tests, as clinically indicated by licensed provider:

Tests will include as clinically indicated:

- HIV Antibody, if not documented previously;
- CD4 Count and/or CD4 Percentage
- Quantitative Plasma HIV RNA (HIV Viral Load)
- Standard genotypic drug-resistance testing Refer to Table 3 in the “Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents Living with HIV” for guidance on other scenarios where genotype testing is recommended
- Co-receptor Tropism Test (if considering use of CCR5 co-receptor antagonist or for patients who exhibit virologic failure on a CCR5 antagonist)
- HLA-B*5701 testing (only before initiating abacavir-containing regimen per guidelines)
- Complete Blood Count (CBC) with Differential and Platelets
- Chemistry Profile: Electrolytes, Creatinine, Blood Urea Nitrogen (BUN)
- Liver Transaminases, Bilirubin (Total and Direct)
- Urinalysis with Urine Protein and Creatinine
- Quantitative HCV RNA viral load testing (for Hepatitis C (HCV)-positive patients who are candidates for treatment)
- Hepatitis A antibody, Hepatitis B surface antigen, core Ab, and surface antibody & Hepatitis C antibody screens at initial intake (providers should screen all HIV-infected patients for anti-HCV antibodies at baseline)
- Lipid Profile (Total Cholesterol, LDL, HDL, Triglycerides); fasting
- Glucose (preferably fasting) or hemoglobin A1C
- Pregnancy Test (for female clients of childbearing potential)
- RPR or treponemal antibody (Syphilis Screening)
- Gonorrhea (GC) and Chlamydia (CT) Testing
- Toxoplasma gondii IgG
- Trichomoniasis Testing

Percentage of new patients with documented initial laboratory tests completed according the OAHS Standard and HHS treatment guidelines.

Percentage of new patients with documented CD4 count (absolute).

Percentage of new patients with documented HIV-RNA viral load. (HRSA HAB Measure)

Percentage of new patients with documented drug resistance testing, as applicable.

Percentage of new patients with a diagnosis of HIV at risk for STIs who had a test for chlamydia within the measurement year. (HRSA HAB Measure)

Percentage of new patients with a diagnosis of HIV at risk for STIs who had a test for gonorrhea within the measurement year. (HRSA HAB Measure)

Percentage of new adult patients with a diagnosis of HIV who had a test for syphilis performed within the measurement year. (HRSA HAB Measure)

Hepatitis B screening was performed at least once since the diagnosis of HIV or for whom there is documented infection or immunity. (HRSA HAB Measure)

Percentage of new patients for whom HCV screening was performed at least once since the diagnosis of HIV. (HRSA HAB Measure)

---

2 Initial Laboratory Tests: https://aidsinfo.nih.gov/guidelines/htmltables/1/5570, see Table 3.
Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

### Other diagnostic testing

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

Chest x-ray will be completed if pulmonary symptoms are present; if positive LTBI test (either TST or Interferon Gamma Release Assay (IGRA)); or if prior evidence of LTBI or pulmonary TB (perform annually).

### Initial Screenings/Assessments

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

Patients should receive screening for opportunistic infections and assessment of psychosocial needs initially and annually according to the most current HHS guidelines.

Screening should include at a minimum:

- Mental health assessment that includes screening for clinical depression (PHQ 2 at a minimum)
- Psychosocial assessment, including domestic violence and housing status
- Substance use and abuse screening
- Tobacco use screening

---

---

Percentage of new or existing patients with documented chest x-ray completed if pulmonary symptoms were present, after an initial positive QTF, after initial positive TST, or annually if prior evidence of LTBI or pulmonary TB.

Percentage of new patients with documented initial medical screenings and assessments as indicated in the OAHS Standard and in accordance with HHS guidelines.

Percentage of new female patients with a diagnosis of HIV who were screened for cervical cancer in the last three years. *(HRSA HAB Measure)*

Percentage of new patients aged 12 years and older screened for clinical depression on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen. *(HRSA HAB Measure)*

Percentage of new patients with documented initial psychosocial assessment to include domestic violence and...
- Pediatric patients (14 years and younger) will be screened for child abuse as defined in Chapter 261 of the Texas Family Code and DSHS policy. Consider screening youth 14-17 for child abuse.
- Oral health exam and assessment
- Tuberculosis (TB) Screening
- Cervical Cancer Screen (*following the most current clinical recommendations*):
  - **Women Aged <30 Years with HIV:**
    - If younger than age 21, known to have HIV or newly diagnosed with HIV, and sexually active, Pap test should be performed within one (1) year of onset of sexual activity regardless of mode of HIV transmission.
  - **Women Aged >30 Years with HIV**
    - **Pap Testing Only:**
      - Pap test should be done at baseline and every 12 months
      - If results of three (3) consecutive Pap tests are normal, follow-up Pap tests can be performed every three (3) years

Additional screenings as medically indicated include:
- Dilated eye exam every 6 to 12 months if the CD4 < 50 by an ophthalmologist

**Anal Cancer (Dysplasia) Screening**
The Anal Cancer (Dysplasia) Screening Guidelines recommend, at a minimum, annual digital examination to detect masses on palpation that could be anal cancer. However, performing the digital exam alone as a screening procedure for anal dysplasia or cancer will miss many lesions. Anal cancer screening using a Pap test can improve sensitivity for detecting anal dysplasia or cancer. Cytology combined with high-resolution anoscopy (HRA) is considered the best strategy for screening of precancerous lesions. If anal Pap

---

is performed, clinicians should refer patients with abnormal anal cytology for HRA. In communities where HRA is not available, clinicians should consider referring patients with abnormal anal cytology to a surgeon for evaluation.

### Immunizations

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

Immunizations/vaccinations will be given according to the most current HHS guidelines and the CDC’s “2017 Adult Vaccination Schedule.” Providers will initiate prophylaxis for specific opportunistic infections.

Patients will be offered vaccinations for the following:

- **Tetanus, Diphtheria, and Pertussis (Tdap)** per recommended treatment guidelines for immunizations
- **Measles, Mumps, Rubella (MMR)** per recommended treatment guidelines for immunizations. *Adults and adolescents with a CD4 cell count <200 cells/uL should not receive MMR.*
- **Influenza** (inactivated vaccine)- annually during flu season October 1st - March 31st
- **Pneumococcal** is recommended for all patients, *two separate vaccines are recommended;*
  - Receive a dose of PCV13, (Prevnar 13), followed by a dose of PPV23 (Pneumovax) at least eight (8) weeks later. For specific guidance on doses and frequency see: https://www.cdc.gov/vaccines/hcp/acip-recs/vacc-specific/pneumo.html
  - Completion of Hepatitis B (HBV) vaccines series, unless otherwise

<table>
<thead>
<tr>

---

documented as immune, vaccinated patients should be tested for HBsAb response 1–2 months or at the next scheduled clinic visits after the third dose see: https://aidsinfo.nih.gov/guidelines/html/4/adult-and-adolescent-opportunistic-infection/365/figure--immunization

- Completion of Hepatitis A (HAV) vaccines series, unless otherwise documented as immune.
- Varicella-Zoster (VZV): Please reference current treatment guidelines for VZV. This vaccination is contraindicated in persons with HIV and CD4 count <200.

*HPV vaccine: The 2017 ACIP recommends and DHHS states: “because of the potential benefit in preventing HPV-associated disease and cancer in this population, HPV vaccination is recommended for HIV infected males and females aged 13 through 26”.
  - For providers who need vaccine to provide their patients at no cost to the provider, please reference: https://www.dshs.texas.gov/immunize/ASN/providers.aspx
  - For providers who want to refer their patients out for vaccines that are offered at no cost or reduced cost, please reference: https://www.dshs.texas.gov/immunize/ASN/public.aspx

### Antibiotic Treatment (Recommend Prophylactic Antibiotic Treatment)

Antibiotic prophylaxis for opportunistic infections will be initiated if active infection has been ruled out and the following conditions are met:

- Mycobacterium avium complex (MAC): if CD4 <50
- Toxoplasmosis: if CD4 <100 and toxoplasma IgG is positive
- PCP Prophylaxis will be completed adhering to the current HHS Guidelines.

Percentage of patients, regardless of age, who are offered MAC Prophylaxis as medically indicated.

Patients aged six weeks or older with a diagnosed of HIV, with CD4 counts of less than 200 cells/μL or a CD4 percentage below 15%, will be prescribed PCP prophylaxis. (HRSA HAB Measure)

</tr>
</tbody>
</table>

**Drug Resistance Testing**

Primary medical care for the treatment of HIV includes the provision of care that is consistent with the most current HHS treatment guidelines.

---

Drug resistance testing must follow most recent, established resistance testing guidelines, including genotypic testing on all ARV-naïve patients. Counseling and education about drug resistance testing must be provided by the patient’s medical practitioner, registered nurse and/or other appropriate licensed healthcare provider (if designated by the practitioner).

### Drug-Resistance Assay Not Usually Recommended
- **After therapy is discontinued:** Drug-resistance testing is not usually recommended more than 4 weeks after ARV drugs are discontinued
- **In patients with low HIV RNA levels:** Drug-resistance testing is not usually recommended in patients with a plasma viral load of <500 copies/mL

### Health Education/Risk Reduction
Health education will adhere to the most current HHS guidelines.

Providers will provide routine HIV risk-reduction counseling and behavioral health counseling for HIV-infected patients.

Since patients’ behaviors change over time as the course of their disease changes and their social situations vary, health education providers will tailor routine risk-reduction counseling and behavioral health counseling not only to the individual patient but also to the particular point in time in the patient’s life.

The following will be conducted initially and as needed:

- Percentage of patients with a diagnosis of HIV who received HIV risk counseling in the measurement year. *(HRSA HAB Measure)*

- Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received cessation counseling intervention if identified as a tobacco user. *(HRSA HAB Measure)*

- Percentage of patients with documented counseling about family planning method appropriate to patient’s status, as applicable.
• Providers should discuss safer sexual practices so to decrease risk of transmitting HIV.
• Providers should counsel HIV-infected patients about the risk of acquiring syphilis and other STIs from unprotected sexual contact, including all sites of possible transmission, such as anus, cervix, vagina, urethra, and oropharynx.
• Providers should discuss family planning with patients
• Contraception counseling/hormonal contraception
• Drug interaction counseling
• Providers should counsel patients on tobacco cessation annually for those patients that were screened and positive for smoking (or document decline of tobacco use)
• When current alcohol or other substance use is identified, providers should discuss the possible effects of such use on the patient’s general health and HIV medications, as well as options for treatment if indicated
• Providers should routinely discuss with patients the importance of disclosure to partners. Patients should be educated about the options for voluntary partner notification.
• When HIV patients are diagnosed with early syphilis (primary, secondary, or early latent), providers should intensify risk-reduction counseling, including discussions about the importance of condom use.
• Nutritional Counseling regarding:
  • Quality and quantity of daily food and liquid intake
  • Exercise (as medically indicated)

| **Treatment Adherence** | Percentage of patients with documented assessment for treatment adherence two or more times within the measurement year if patient is on ART. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------
| Assessment of treatment adherence and counseling will be provided that adheres to current HHS guidelines. | Percentage of patients with documented adherence issues who received counseling for treatment adherence two or more times within the measurement year. |
| Patients are assessed for treatment adherence and counseling at a minimum of twice a year. | |
| Those who are prescribed on-going ART regimen must receive adherence assessment and counseling on every HIV-related clinical encounter. | |
| If adherence issue is identified by another member of the healthcare team (MCM, MA, LVN, RN), there is documented evidence of adherence counseling and follow-up action. This adherence counseling documentation must be evident in the patient’s medical record and clearly indicated that the prescribing provider was made aware of the adherence issue. | |
| **Referrals** | Percentage of patients, as medically indicated, who had documentation of referrals for: |
| Providers will refer to specialty care or other systems as appropriate in accordance with current HHS guidelines. | - Mental Health and/or Substance Use  
- Oral Health  
- Ophthalmological services  
- Child abuse if suspected abuse  
- Disease intervention specialist  
- Other specialty services. |
| At a minimum, patients should receive referrals to specialized health care/providers/services **as needed or medically indicated** to augment medical care:  
- If CD4 count below 50, should be referred for examination by an ophthalmologist.  
- AIDS Drug Assistance Program (ADAP)  
- Medication Assistance Programs  
- Medical care coordination  
- Medical specialties  
- Mental health and substance use services -Treatment education services  
- Partner counseling and referral  
- Annual oral hygiene and intraoral examinations, including dental caries | Percentage of patients with a documented referral in the measurement year, has a progress note in the patient’s chart regarding attendance, and outcomes of the referral. |
and soft-tissue examinations.

- Medical Nutrition Therapy (MNT)
- Health maintenance, as medically indicated, such as:
  - Cervical Cancer Screening
  - Family Planning
  - Colorectal cancer screening
  - Breast cancer screening
- Specialty medical care for any preexisting chronic diseases
- Case Management Services or a Disease Investigation Specialist (DIS) for follow-up if missing appointments.

Providers/staff are expected to follow-up on each referral to assess attendance and outcomes.

For specific details regarding screening modalities and timeframes see: see the United States Preventive Services Task Force (http://www.ahrq.gov/clinic/USpstfix.htm).

### Follow-up Visits

Outpatient Medical Care will adhere to the current HHS guidelines for ongoing health care.

Reassessment/reevaluation of health history, comprehensive physical examination, and annual laboratory testing should be documented in patient medical record.

All HIV patients should have the following lab tests documented:

- Annually: urinalysis, with urine protein and creatinine; fasting lipid profile; syphilis screening; and gonorrhea and chlamydia testing (screen all sites of possible exposure). These tests may need to be performed more frequently, if clinically indicated.

| Percentage of existing patients with documented initial medical screenings and assessments as indicated in the OAHS Standard and in accordance with HHS guidelines. |
| Percentage of patients, regardless of age, with a diagnosis of HIV who had at least one medical visit in each 6-month period of the 24-month measurement period with a minimum of 60 days between medical visits. *(HRSA HAB Measure)* |
| Percentage of patients, regardless of age, with a diagnosis of HIV who did not have a medical visit in the last 6 months of the measurement year. *(HRSA HAB Measure)* |
| Percentage of patients, regardless of age, with a diagnosis of HIV who did not have a medical visit in the last 6 months of the measurement year. *(HRSA HAB Measure)* |
Every 3-6 months\(^9\): HIV-RNA viral load; CBC with differential; chemistry profile (to include electrolytes, BUN, creatinine, HCO\(_3\), estimated GFR); liver function tests (to include transaminases, total and direct bilirubin); and glucose\(^{10}\) (preferably fasting) or hemoglobin A1c. These tests may need to be performed more frequently, if clinically indicated.

Providers will continually evaluate patients for adverse outcomes and documents actions taken, outcomes, and follow-up.

---

| Percentage of existing female patients with a diagnosis of HIV who were screened for cervical cancer in the last three years. (HRSA HAB Measure) |
| Percentage of existing patients with a diagnosis of HIV at risk for STIs who had a test for chlamydia within the measurement year. (HRSA HAB Measure) |
| Percentage of existing patients with a diagnosis of HIV at risk for STIs who had a test for gonorrhea within the measurement year. (HRSA HAB Measure) |
| Percentage of existing adult patients with a diagnosis of HIV who had a test for syphilis performed within the measurement year. (HRSA HAB Measure) |
| Percentage of existing patients aged 12 years and older screened for clinical depression (annually) on the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the positive screen. (HRSA HAB Measure) |
| Percentage of existing patients with documented annual psychosocial assessment to include domestic violence and housing status. |
| Percentage of existing patients with a diagnosis of HIV who have been screened for substance use (alcohol & drugs) in the
