Measles Overview

TEXAS
Health and Human
Services

Texas Department of State
Health Services

Measles

- Measles is highly contagious.
- If one person has it, up to 9 out of 10 people will become infected if they are not protected.
- Anyone who is not protected against measles is at risk
- The best protection against measles is measles, mumps, and rubella (MMR) vaccine.
 - MMR vaccine provides long-lasting protection against all strains of measles.
- Measles can cause serious health complications, especially in children younger than 5 years of age, pregnant women, and people who are immunocompromised.

Measles Clinical Features

- Incubation period 11 to 12 days
 - Exposure to rash onset averages 14 days (range 7-21 days)
- Prodrome lasts 2 to 4 days (range 1-7 days)
 - Stepwise increase in fever to 103-105°F
 - Cough, coryza, and conjunctivitis (three "C"s)
 - Koplik spots (on mucous membranes)
- Rash
 - Persists 5 to 6 days
 - Begins at the hairline, then involves the face and upper neck
 - Proceeds downward and outward to hands and feet
 - Severe areas peel off in scales
 - Fades in order of appearance

Measles Clinical Presentation

Koplik spots

Measles rash on the forehead

Measles Clinical Presentation

Maculopapular rash on cheek

Child with classic measles rash

Skin sloughing off of a child healing from measles infection

Measles Complications

- Common complications from measles include otitis media, bronchopneumonia, laryngotracheobronchitis, and diarrhea.
- Even in previously healthy children, measles can cause serious illness requiring hospitalization.
- 1 out of every 1,000 measles cases will develop acute encephalitis, which often results in permanent brain damage.
- 1 to 3 out of every 1,000 children who become infected with measles will die from respiratory and neurologic complications.
- Subacute sclerosing panencephalitis (SSPE) is a rare, but fatal degenerative disease of the central nervous system characterized by:
 - Behavioral and intellectual deterioration.
 - Seizures that generally develop 7 to 10 years after measles infection.
 - On September 11, 2025, [LA County Public Health Department](#) reported a child death from a measles-related complications
 - The child was originally infected with measles as an infant before they were eligible to receive the measles vaccine
 - Although they recovered from the initial measles illness, the child developed and ultimately died from SSPE.

History of measles cases in the U.S., 1962–2023

†Measles was declared eliminated in the U.S. in 2000 . Elimination is defined as the absence of endemic measles transmission in a region for ≥12 months in the presence of a well-performing surveillance system.

Measles in the Region of the Americas, 2025

Spatial distribution of confirmed measles cases in the Americas, 2025

Country	No. of cases	Week of Last Case
Canada	4,849	8/30/25
Mexico	4,452	8/30/25
Unites States	1,454	8/6/25
Bolivia	274	8/23/25
Brazil	22	8/2/25
Argentina	35	6/28/25
Belize	34	6/28/25
Paraguay	24	8/9/25
Peru	4	5/17/25
Costa Rica	1	5/17/25
Total	11,103	

- This is a **33-fold increase** in measles cases compared to the same period in 2024 (339 cases reported during January–August 2024)
- In 2025*, there have been **22 deaths** reported among unvaccinated people in Mexico (18), the U.S. (3), and Canada (1)

Data as of September 9, 2025. Data are preliminary and subject to change.

Texas 2025 Measles Outbreak

Texas 2025 Measles Outbreak – At-A-Glance

- Outbreak period: January 20, 2025 – August 18, 2025
- On August 18, 2025, [Texas Department of State Health Services \(DSHS\) announced the end of the measles outbreak.](#)
- A total of 762 confirmed cases
 - 99 Hospitalizations
 - 12 ICU Admissions
 - Two fatalities in school-aged children who lived in the outbreak area. The children were not vaccinated and had no known underlying conditions.

Texas 2025 Measles Outbreak Epi Curve of Confirmed Cases (1/20/2025 – 8/18/2025)

Confirmed Cases = 762 Cases

Data based on the following hierarchy according to available data: rash onset date, symptom onset date, specimen collection date, hospital admission date, or date reported to the region.

Lamb	1	0.1%
Lubbock	52	6.8%
Lynn	2	0.3%
Martin	3	0.4%
McLennan	9	1.2%
Midland	6	0.8%
Parmer	5	0.7%
Potter	1	0.1%
Randall	1	0.1%
Reeves	2	0.3%
Rockwall	1	0.1%
Terry	60	7.9%
Upshur	5	0.7%
Yoakum	20	2.6%
Total	762	100.0%

Outbreak Cases by County

Texas 2025 Measles Outbreak

Confirmed Cases by Sex

*Unknown = 2

Outbreak Cases by Age

Age Group	Confirmed	Percent of Total
0-4 Yrs	225	29.5%
5-17 Yrs	286	37.5%
18+ Yrs	247	32.4%
Unknown	4	0.5%

Outbreak Cases by Vaccination Status

Vaccination Status	Confirmed	Percent of Total
Unvaccinated/Unknown	718	94.2%
Vaccinated: 1 dose	23	3.0%
Vaccinated: 2+ Doses	21	2.8%

Note: The unvaccinated/unknown category includes people with no documented doses of measles vaccine more than 14 days before symptom onset.

Measles Outbreak
Vaccine
Recommendation
Summary

Texas Department of State
Health Services

Measles Outbreak Vaccine
Recommendations

for those who live in or visit counties with ongoing measles spread

0 to 6 months

Vaccine is NOT
recommended

1 year to adult

0

Previous Vaccine Doses

- Should receive first dose immediately.
- Should receive second dose at least 28 days later.

1

Previous Vaccine Doses

- Should receive a second dose of MMR vaccine, at least 28 days after first dose.

2

Previous Vaccine Doses

- Fully vaccinated.

6 to 11 months

0

Previous Vaccine Doses

- Should receive an early dose of vaccine immediately
- Should receive two additional doses of MMR vaccine:
 - First dose at 12- 15 months
 - Second dose at 4- 6 years
- Give each dose at least 28 days apart

Measles Outbreak in Texas

Measles Frequently Asked Questions

Information for Health Care Providers >

Information for Schools & Groups

The Texas Department of State Health Services is reporting a measles outbreak in the South Plains and Panhandle regions of Texas. Measles is a highly contagious viral infection, which can cause life-threatening illness to anyone who is not vaccinated. Measles can be prevented with the measles-mumps-rubella (MMR) vaccine. DSHS is working with local health departments to investigate and respond to the outbreak.

[Find measles resources at the bottom of the page](#)

Symptoms

Early symptoms (first few days):

- Moderate fever
- Cough
- Runny nose
- Red eyes
- Sore throat

Later symptoms (after a few days):

- Blue-white spots inside the mouth (Koplik spots)
- Red-brown rash that starts at the hairline and spreads down the body
- High fever (can go over 104°F)

The rash usually appears 14 days after exposure. Some immunocompromised people may not develop the rash.

When to seek emergency care

Measles typically starts with cough, runny nose, and red eyes and often leads to a rash and fever over 101 degrees Fahrenheit. If you think you have measles, get medical care. Symptoms can become worse over time, complications can develop, and measles can be deadly if you don't receive appropriate care. If you have any of these symptoms, go to the emergency room immediately:

- A hard time breathing or breathing faster than normal
- Signs of severe dehydration (dry nose and mouth, urinating less than usual)

Additional Measles Resources

Measles is spreading.

What to know to protect your family.

Measles is an airborne, highly contagious disease

Measles can frequently lead to hospitalization

Measles can be deadly, especially for babies and young children

The measles vaccine has been protecting Texans for generations

Don't wait. Contact your doctor to schedule a measles vaccine. If you're infected, 90% of those around you who are not protected will also become infected.

For a vaccine near you, visit dshs.texas.gov/measles.

Texas Department of State Health Services

Every Dose Matters.

SYMPTOMS

Cough
Runny nose
Fever
Pink eye
Rash

When to go to the ER for measles

Look out for serious symptoms—you might need emergency care

Measles typically starts first with cough, runny nose and red eyes and often leads to a rash and fever over 101 degrees Fahrenheit. If you think you have measles, get medical care. Symptoms can become worse over time, complications can develop, and measles can be deadly if you don't receive appropriate care.

If you have any of these symptoms, go to the emergency room immediately:

A hard time breathing or breathing faster than normal

Signs of severe dehydration (dry nose and mouth, urinating less than usual)

Confusion, decreased alertness, or severe weakness

For young children: a blue color around the mouth, crying without making tears, unusually low energy, or severe loss of appetite

FAQ About Measles

General Information

Where is measles spreading?

How do I prevent getting measles?

Can vitamin A help treat or prevent measles?

Information for Health Care Providers

This webpage includes measles information for health care providers about minimization of infection control procedures, treating patients, and testing.

Find information about the current outbreak on the [DSHS website](#).

More [measles resources for health care providers](#) are available at the bottom of this page.

Minimizing Exposure

If possible, health care providers should prepare in advance to treat patients with cases, including to:

- Ensure health care personnel have presumptive evidence of measles immunity. Evidence of measles can be found on the [CDC website](#).
- Have a plan for how your facility will:
 - Appropriately manage [exposed and ill health care personnel](#).
 - Quickly identify and isolate patients with known or suspected measles.
 - Adhere to [standard](#) and [airborne](#) precautions for people with known or suspected measles.
- Routinely promote and facilitate [respiratory hygiene and cough etiquette](#), and:
 - Face masks to people with respiratory symptoms or close contact exposures.
 - Alcohol-based hand sanitizer dispensers.
 - Tissues and no-touch receptacles to dispose of used tissues.
 - Hand washing supplies at sinks, where applicable.

Visit the CDC [Interim Infection Prevention and Control Recommendations for Measles Settings](#) webpage for more information.

Initial Infection Control Procedures

Screen all patients, visitors, and health care personnel for measles signs and symptoms. If a suspected or confirmed measles case comes to your facility, immediately mask and isolate the patient in a [patient airborne infection isolation room \(AIIR\)](#). If an AIIR is not available, temporarily close the door until the person can be transferred to an AIIR. Persons with suspected measles should not be in the waiting room or other facility common areas.

Measles Vaccine Frequently Asked Questions

What kind of vaccine is it?

Information for Schools & Groups

[Interim Guidance for Measles in Schools, March 2025](#) [🔗](#)

[Find more measles resources for schools and groups at the bottom of the page](#)

Measles spreads easily in places where people gather, including homes, schools, day cares, homeless shelters, and other group gatherings.

How can schools and child care centers prepare for measles?

Schools and child care centers with unvaccinated students/personnel have a higher risk of measles spreading if an outbreak happens. To protect students and staff, schools should:

- Keep accurate vaccination records for all students and staff, and know which students have exemptions for vaccination.
- Prepare exposure letters in advance to inform parents and staff if a measles case occurs.
- Encourage vaccination for students who are missing [MMR \(measles, mumps, and rubella\) vaccine](#) doses:
 - First dose for those unvaccinated.
 - Second dose for those who only have one dose (must be at least 28 days apart).
- Encourage routine hygiene by making handwashing and covering coughs and sneezes a priority for students and staff.

Thank you
