Infectious Agent
Hepatitis B virus (HBV), a hepadnavirus.

Transmission
- Sexual activity with an infected person
- Transfusion of contaminated blood or blood products
- Perinatally (either in utero or at delivery)
- Sharing or reusing non-sterilized needles, syringes, razors, toothbrushes, manicure equipment, or any other items which may contain the blood or body fluid of an infected person
- Percutaneous or mucous membrane exposure to blood or body fluids of an infected person
- Tattooing and/or body piercing

Incubation Period
The incubation period is 45–180 days with an average of 60–90 days

Communicability
The blood of infected persons is infective many weeks before the onset of symptoms and remains infective through the acute clinical course of the disease and during the chronic carrier state, which may persist for life. The younger a person is when infected, the more likely it is he or she will become chronic disease carriers. Additionally, persons who are hepatitis B e antigen (HBeAg, also referred to as “little e antigen”) positive are highly infectious.

Clinical Illness
The clinical course of acute hepatitis B is indistinguishable from that of other types of acute viral hepatitis. Clinical signs and symptoms occur more often in adults than in infants or children, who usually have an asymptomatic acute course. However, approximately 50% of adults who have acute infections are asymptomatic.

The prodromal phase from initial symptoms to onset of jaundice usually lasts from 3 to 10 days. It is non-specific and is characterized by a slow onset of malaise, anorexia, nausea, vomiting, right upper quadrant abdominal pain, fever, headache, myalgia, skin rashes, arthralgia and arthritis, and dark urine. The icteric phase is variable but usually lasts from 1 to 3 weeks and is characterized by jaundice, light or gray stools, hepatic tenderness and hepatomegaly (splenomegaly is less common). During convalescence, malaise and fatigue may persist for weeks or months, while jaundice, anorexia, and other symptoms disappear.

Most acute HBV infections in adults result in complete recovery with elimination of hepatitis B surface antigen (HBsAg) from the blood and the production of hepatitis B surface antibody (anti-HBs), creating immunity to future infection.

Recent hepatitis B vaccination can cause transient HBsAg positivity for up to 18 days post-vaccination. Retesting is needed to determine the true HBV infection status in patients who tested positive for HBsAg shortly after hepatitis B vaccination.
Hepatitis B, Acute & Perinatal

Note: Refer to Table 1 for hepatitis B diagnostic test definitions and abbreviations and Table 2 for interpretation of hepatitis B serological tests.

Hepatitis B, Acute Clinical Case Definition
An acute illness with a discrete onset of any sign or symptom* consistent with acute viral hepatitis (e.g., fever, headache, malaise, anorexia, nausea, vomiting, diarrhea, and abdominal pain), AND
- Jaundice, OR
- Elevated serum alanine aminotransferase levels (ALT) >100 IU/L.

* A documented negative hepatitis B surface antigen (HBsAg) laboratory test result within 6 months prior to a positive test result (i.e., HBsAg, hepatitis B “e” antigen [HBeAg], or hepatitis B virus nucleic acid testing [HBV NAT] including genotype) does not require an acute clinical presentation to meet the surveillance case definition.

Laboratory Criteria for Diagnosis
- Hepatitis B surface antigen (HBsAg) positive AND
- IgM antibody to hepatitis B core antigen (anti-HBc IgM) positive (if done)

Remember, if HBsAg test alone is done for a case and is positive, it will help the case meet the criteria if it meets clinical case description. But if anti-HBc IgM is also done, then it needs to be positive along with HBsAg positive result to meet the criteria.

If a public health department must prioritize hepatitis B labs to investigate, persons with a positive HBsAg and a positive anti-HBc IgM should be investigated first before persons with only a positive HBsAg.

Case Classification
- Confirmed:
  - A case that meets the clinical case definition, is laboratory-confirmed, and is known not to have chronic hepatitis B**
- Probable:
  - There is no probable case definition for acute hepatitis B

** A person should be considered chronically infected if the hepatitis B surface antigen (HBsAg) has been positive for 6 months or longer or if the patient has a history of chronic hepatitis B diagnosis.

Note: Persons with chronic hepatitis B virus (HBV) infection may have no evidence of liver disease or may have a spectrum of disease ranging from chronic hepatitis to cirrhosis or liver cancer. Persons with chronic infection may be asymptomatic. Please note that chronic hepatitis B is not a reportable condition in Texas.

Note: Recent hepatitis B vaccination can cause transient HBsAg positivity for up to 18 days post-vaccination. Retesting is needed to determine the true HBV infection status in patients who tested positive for HBsAg shortly after hepatitis B vaccination.

Hepatitis B, Perinatal

Clinical Case Definition
Perinatal hepatitis B (HBV) in the newborn may range from asymptomatic to fulminant hepatitis.

Laboratory Criteria for Diagnosis
Hepatitis B surface antigen (HBsAg) positive*** OR
Hepatitis B e antigen (HBeAg) positive OR
Detectable hepatitis B virus DNA (HBV DNA)

*** HBsAg must be tested more than 4 weeks after last dose of hepatitis B vaccine to be considered confirmatory

Case Classification

Confirmed:
- Child born in the US to a HBV-infected mother AND
  - Positive for HBsAg at ≥ 1 month of age and ≤ 24 months of age OR
  - Positive for HBeAg or HBV DNA ≥9 months of age and ≤ 24 months of age.

Probable:
- Child born in the US whose mother’s hepatitis B status is unknown (i.e., epidemiologic linkage not present) AND
  - Positive for HBsAg at ≥ 1 month of age and ≤ 24 months of age OR
  - Positive for HBeAg or HBV DNA ≥9 months of age and ≤ 24 months of age.

Notes:
- If the mother is known to NOT be infected with HBV, refer to the case definition for acute hepatitis B.
- These definitions are used for surveillance purposes only, not for perinatal hepatitis B prevention case management purposes.
- A pregnant woman with hepatitis B should NOT be entered into NBS as a perinatal case. Perinatal cases must be 24 months of age or younger. Positive pregnant women with acute hepatitis B should be entered as acute cases. If a pregnant woman has chronic hepatitis B, she can be entered as a chronic case of hepatitis B if the jurisdiction chooses to maintain a database of chronic hepatitis B patients, but NBS notifications should not be submitted for chronic hepatitis B cases since this is not a reportable condition. She should be case managed through the Perinatal Hepatitis B Prevention Program.

SURVEILLANCE AND CASE INVESTIGATION

Case Investigation
Acute hepatitis B surveillance is used to 1) identify contacts of case-patients who may require testing or prophylaxis; 2) detect outbreaks; 3) identify infected persons who need counseling and referral for medical management; 4) monitor disease incidence and prevalence; and 5) determine the epidemiologic characteristics of infected persons, including the source of their infection, to assess and reduce missed opportunities for vaccination. See Getting the Most Out of Surveillance below for more information on conducting hepatitis B surveillance activities.

Case Investigation Checklist
- Confirm that laboratory results meet the case definition.
  - See Evaluating Suspected Cases below.
  - If the case is pregnant, refer to the Perinatal Hepatitis B Program regardless of acute or chronic infection. See Perinatal Hepatitis B Investigations in the Managing Special Situations section for more information.
- Review medical records or speak to an infection preventionist or physician to verify case definition, underlying health conditions, course of illness, vaccination status and travel history.
  - Use the Viral Hepatitis Case Tracking Form to record information.
Hepatitis B, Acute & Perinatal

- See Information to Collect for Acute Hepatitis B below.
- Interview the case (See Interviewing the Patient below).
- Determine vaccination status of the case. Sources of vaccination status that should be checked include:
  - Case (or parent), ImmTrac2, school nurse records, primary care provider, etc.
- Identify and follow-up with all close contacts. See Contact Investigations below.
  - Provide education on hepatitis B.
  - Recommend testing.
  - Evaluate susceptibility status.
  - Offer or recommend vaccination as appropriate.
- If an acute case is a healthcare worker, a recent blood donor, a transplant recipient, suspected to have been infected in a healthcare setting, less than 2 years old or pregnant see the Managing Special Situations.
- Send the completed Viral Hepatitis Case Tracking Form to DSHS.
- All confirmed case investigations must be entered and submitted for notification in the NEDSS Base System (NBS). Please refer to the NBS Data Entry Guidelines for disease specific entry rules.
- Make sure to answer all the questions in Hepatitis Extended tab in NEDSS with Yes or No as far as you can, if you have interviewed the case. If you were not able to interview the case due to case being lost to follow up, refused to answer, being hospitalized or deceased, you can answer the questions as unknown and give the specific reason in the NEDSS comment section.

**Information to Collect for Acute Hepatitis B**
The following information is epidemiologically important to collect in a case investigation for acute hepatitis B. The Viral Hepatitis Case Tracking Form includes spaces to record most of this information. All information collected during investigation should be entered into NBS.

- Demographic information
- Clinical details
  - Date of illness onset
  - Symptoms, including jaundice
  - Hospitalization
  - Provider information
- Laboratory results
- Vaccination status
- Risk behaviors and exposures
  - Sexual
  - Drug use
  - Tattoos/piercings
  - Healthcare
    - Receipt of organs/blood products
    - Accidental needle stick
    - Medical/dental procedures
    - Hospitalization/residents in long term care facilities
  - Other blood exposure
  - Occupational
  - Incarceration
- Contact investigation and prophylaxis
  - Sexual contacts
  - Household contacts
  - Pregnancy status
  - Bloodborne exposures (e.g., recently donated blood or an organ)

**Evaluating Suspected Cases of Acute Hepatitis B**
Evaluate the diagnosis
  o Review laboratory tests
    ▪ Identify all HBsAg+ and/or anti-Hep B IgM+ results in NBS or received via fax.
    ▪ Check patient’s name in NBS to see if patient was already identified as a hepatitis B case or has previous (>6 mo) positive lab results for hepatitis B.
      • If patient has a previous positive hepatitis lab result or a hepatitis B investigation, mark lab as reviewed. **HBsAg+ lab results that were not submitted via NBS should be shared with the perinatal program for women 13-50.**
  o Contact provider
    ▪ If patient is not identified as previously reported acute or chronic case, contact the healthcare provider for additional laboratory and clinical information, and pregnancy status if age/gender appropriate.
      • If patient is pregnant, refer to perinatal program.
      • If patient is not pregnant and the provider indicates the patient is a known chronic case OR the patient’s clinical information is not consistent with acute hepatitis B, investigation can be closed.
        o Mark lab as reviewed in NBS OR
        o If an acute investigation was opened in NBS, close as “not a case” (and do not send a notification) OR
          o If desired and appropriate, enter the case in NBS as a chronic hepatitis B case. Do not submit a notification.
    ▪ If patient is identified as acute by provider or has a clinical presentation consistent with acute hepatitis B, continue investigation.
    ▪ Contacting the provider can be done by fax, phone, e-mail or mail.
      o Some health departments find it useful to initiate contact with a form letter that the provider completes with information on pregnancy status, clinical information, chronic status, and any additional liver test results.

Control Measures
Identify the source of infection.
  o Obtain information on high-risk behaviors, medical/dental/commercial procedures in 45-180 days prior to onset.
    ▪ Close contact with any household or sexual contact with acute or chronic hepatitis B infection
    ▪ Receipt of blood transfusion or other blood products
    ▪ History of dental or surgical care including renal dialysis
    ▪ Blood exposure through needles, tattooing, piercing or acupuncture
    ▪ Accidental exposure of skin, eyes, mucous membranes, or a wound to blood of another person
    ▪ Work in occupational settings with elevated risk of exposures (e.g., medical, dental, or clinical laboratory work, or employment in facilities for mentally disabled persons)
    ▪ Sexual contact with multiple sex partners or a sex partner with a risk factor
  o Possible sources should be pursued if additional exposures may be prevented (e.g., illegal tattooing, likely healthcare transmission, etc.).

Identify potentially exposed persons.
Managing Close Contacts
Evaluate immunization and disease history of household and sexual contacts.
- **Susceptible**: persons who are not immune to HBV or who have not been appropriately vaccinated against HBV.
- **Protected**: persons with adequate antibody response (anti-HBs > 10 milli-IUs/mL) due to vaccination or natural infection.
- **Primary non-responder**: persons who do not demonstrate adequate antibody response after three doses of hepatitis B vaccine.
- **Non-responder**: persons who have received two complete series of the hepatitis B vaccine but still do not demonstrate adequate antibody response.
- **Unknown**: persons whose anti-HBs status is unknown are always considered susceptible.

Test or refer for testing as appropriate.
Offer vaccine or refer to provider for vaccine, if susceptible (see the Red Book for current recommendations).
Offer education on preventing hepatitis B.
Refer to prevention and/or treatment resources.
Refer acute cases to provider for follow-up testing to establish resolution or carrier status.
- Offer education on reducing risk of further transmission.
- Refer to treatment.

**Exclusion**
There is no exclusion for cases of acute hepatitis B.

**MANAGING SPECIAL SITUATIONS**

**Perinatal Hepatitis B Investigations**
Any woman that has a positive hepatitis B laboratory result AND is known to be pregnant must be referred to the Perinatal Hepatitis B Prevention Program for case management. Any woman aged 10-55 that has an unknown pregnancy status and a positive hepatitis B lab result should also be referred to the Perinatal Hepatitis B Prevention Program for further investigation of pregnancy status.
- Currently all positive hepatitis B surface antigen results for women aged 13-50 that are reported electronically to NBS are reviewed for pregnancy status by EAIDU each week.
- Labs that are connected to prenatal or obstetric care are shared with the Perinatal Hepatitis B Prevention Program for review and case management.
- Lab results that belong to women aged 13-50 with unclear pregnancy status are also referred to the Perinatal Hepatitis B Prevention Program for follow up in determining pregnancy status.
- If patient has a previous positive hepatitis lab result or a hepatitis B investigation, mark lab as reviewed. HBsAg+ lab results that were not submitted via NBS should be shared with the perinatal program for women 10-55.
Preventing perinatal transmission is perhaps the most important part of hepatitis B surveillance, and for this reason DSHS has an official Perinatal Hepatitis B Prevention Program for Texas. The program has extensive information on diagnosis, case management, and follow-up of pregnant women with hepatitis B and their infants. Their program can be accessed at: http://www.dshs.state.tx.us/idcu/disease/hepatitis/hepatitis_b/perinatal/ or at 512-776-6634. Even though pregnant HBsAg + women and their infants are case managed by the perinatal program, infants infected perinatally with hepatitis B are reported to the CDC through NBS.

The information provided below is the information that is needed for perinatal hepatitis B surveillance information that is shared with the CDC via NBS. This information should be available on the perinatal hepatitis B prevention program’s case management forms, a separate investigation/reporting form is not needed.

- Demographic information
  - Infant
  - Mother
- Clinical details
  - Laboratory results and dates for mother
  - Laboratory results and dates for infant
- Vaccination
  - Dates
  - HBIG information including date and time
  - Was series given more than once

All information collected for confirmed perinatal hepatitis B investigations should be entered into NBS within 30 days of the report of a positive hepatitis B lab on the infant. Investigation forms (or a copy of the infant and mother’s perinatal program case management forms) should be submitted to EAIDU.

Positive Lab Results Received on a Child Under 2 years old
All positive laboratory results indicative of hepatitis B infection in children under 2 should be investigated to ensure the child is not a case of perinatal hepatitis B.

1. Ascertain if additional laboratory results exist in NBS.
2. Contact the submitting laboratory or provider to find additional laboratory results and information on the mother’s hepatitis B status.
3. If mother is positive and child has acute or chronic infection, investigate as a potential missed perinatal case.

Case is a Health Care Worker (HCW)
If the case is a dentist, physician, nurse, or other health care worker (HCW) with potential for exposing patients by blood or other body fluids:

1. The HCW should be discouraged from working until the acute clinical illness has resolved.
2. Upon returning to work, special precautions should be practiced until the HCW is no longer infectious, including:
   a. Wearing gloves for all procedures during which the hands will be in contact with the patients’ mucosal surfaces or broken skin
   b. Avoiding situations involving sharps that could lead to exposures of susceptible individuals to blood or objects contaminated with blood of the case
   c. Careful and frequent hand washing

Health Care Associated Infection is Suspected
If two or more iatrogenic (health care associated) cases occur in patients of the same dental or health care provider, residential care facility, or non-hospital health care facility (e.g., dialysis
Hepatitis B, Acute & Perinatal

Case is a Recent Blood Donor
If the case has donated blood or plasma within the eight weeks prior to onset of symptoms, the agency that received the blood or plasma should be notified so that any unused product can be recalled.

Case is a Recent Transfusion Recipient
If transfused blood or blood products are suspected as the possible source of infection, the blood bank or other agency that provided the implicated lot should be notified so that aliquots of the blood still on hand (or the donors themselves) can be retested for HBsAg or tested for anti-HBc. Lot numbers for tracking are usually available through the blood bank at the hospital where the units were transfused.

Getting the Most Out of Surveillance
- Provider education
  - Providers should be educated about the importance of performing appropriate serologic tests to determine the etiology of viral hepatitis and reporting all cases of acute and perinatal HBV. Providers are required by Texas law to test pregnant women for hepatitis B.
  - Hospitals and infection control practitioners should be encouraged to report all persons with acute viral hepatitis (ICD-10 code B16), and all births to HBsAg-positive women. This is required by Texas Administrative Code (TAC).
- Case investigation
  - Case investigation is essential for determining contacts who are eligible for prophylaxis and for collection of risk factor data.
  - Analysis of risk factor data can identify populations where targeted interventions may be needed.
- Laboratory reporting
  - Laboratories should be encouraged to report all persons with serologic markers of acute or chronic hepatitis to the state or local health department.
    - Currently Texas receives over 50,000 hepatitis B laboratory results through NBS. At this time, only IgM anti-HBc and HBsAg results populate the “Documents Requiring Review” queue (where all electronic laboratory results first appear). All other hepatitis B laboratory results are automatically “swept” off that queue by the system. They are still stored in NBS and can be located by searching for a specific patient or by running a report for one or more specific laboratory results.
    - All IgM anti-HBc and HBsAg positive results should be reported.
    - To facilitate reporting, these laboratory results are included in the state’s list of laboratory-reportable conditions.
- Monitoring surveillance indicators
  - Regular monitoring of surveillance indicators, including date of report, timeliness, and completeness of reporting, may identify specific areas of the surveillance and reporting system that need improvement. Important program indicators that can be monitored through the surveillance, reporting and case investigation system include the following:
    - Characteristics of cases of acute hepatitis B that occur in children and adolescents younger than 20 years of age and missed opportunities for vaccination
    - Characteristics of cases of acute hepatitis in which death has occurred
• Characteristics of cases of acute hepatitis B in persons reporting a history of vaccination
• Characteristics of cases of acute hepatitis B in persons over 70 years of age
• Characteristics of cases of acute hepatitis B associated with healthcare transmission

• Registries/databases for HBsAg-positive persons

NBS can serve as a de facto chronic B registry and the positive hepatitis B results can be used to distinguish newly reported cases of infection from previously identified cases.

Outbreaks
If an outbreak of hepatitis B is suspected, notify the regional DSHS office or EAIDU at (800) 252-8239 or (512) 776-7676.

REPORTING AND DATA ENTRY REQUIREMENTS

Provider, School & Child-Care Facilities, and General Public Reporting Requirements
Perinatal hepatitis B cases are required to be reported within one work day. Confirmed acute hepatitis B cases are required to be reported within 1 week to the local or regional health department or to DSHS EAIDU at (800) 252-8239 or (512) 776-7676.

Local and Regional Reporting and Follow-up Responsibilities
Local and regional health departments should:
• Enter the case into NBS and submit an NBS notification on all confirmed or probable perinatal hepatitis B as well as confirmed acute hepatitis B cases to DSHS within 30 days of receiving a report of a confirmed case.
  o Please refer to the NBS Data Entry Guidelines for disease-specific entry rules.
  o A notification can be sent as soon as the case criteria have been met. Additional information from the investigation may be entered upon completing the investigation.
  o Please do not send a notification on chronic hepatitis B cases entered into NBS.
• Fax, send a secure email, or mail a completed investigation form within 30 days of completing the investigation.
  o In the event of a death, copies of the hospital discharge summary, death certificate, autopsy report and death investigation form should also be sent to DSHS EAIDU.
  o Investigation forms may be faxed to 512-776-7616, securely emailed to VPDTexas@dshs.texas.gov or mailed to:
    Emerging and Acute Infectious Disease Unit Texas Department of State Health Services Mail Code: 1960
    PO Box 149347
    Austin, TX 78714-9347
• HBsAg-positive pregnant women (acute and chronic infections) should also be reported to the DSHS Perinatal Hepatitis B Prevention Program at (512) 776-6634 or at https://txhhs.force.com/DSHSPeriHepBPreventionPortal/s/.
  o For information on perinatal hepatitis B prevention activities, please refer to the Perinatal Hepatitis B Prevention Program Manual at www.dshs.state.tx.us/idcu/disease/hepatitis/hepatitis%5Fb/perinatal/manual/.

When an outbreak is investigated, local and regional health departments should:
• Report outbreaks within 24 hours of identification to the regional DSHS office or to EAIDU at (800) 252-8239 or 512-776-7676.
LABORATORY PROCEDURES

Testing for hepatitis B is widely available from most hospital and commercial laboratories. If hepatitis B testing is needed through the DSHS State Laboratory, please contact the EAIDU VPD Team at (800) 252-8239 or (512) 776-7676.

For testing in regard to a possible perinatal case, please contact the Perinatal Hepatitis B Prevention Program at (512) 776-6634.

REVISION HISTORY

January 2021
  o No updates

January 2023
  o Updated prioritization of investigations criteria
**Table 1. Diagnostic Tests for Hepatitis B Virus (HBV) Antigens and Antibodies**

*1. May be recovering from acute HBV infection.
2. May be distantly immune and test not sensitive enough to detect very low level of anti-HBs in serum
3. May be susceptible with a false positive anti-HBc.
4. May be undetectable level of HBsAg present in the serum and the person is actually a carrier.

**Source:** Adapted from Centers for Disease Control and Prevention (CDC).
Acute Hepatitis B (HBV): Case Status Classification

- Notified of suspected case
  - Texas Resident?
    - Yes
      - Is suspected case younger than 24 months or a pregnant woman?
        - Yes
          - Promptly report case to Perinatal Hepatitis B Prevention Program. Work with the perinatal program to determine the case status of both the mother and the baby.
        - No
          - Acute illness with discrete onset of symptoms?
            - Yes
              - Jaundice or elevated serum alanine amino transferase levels (>100IU/L)?
                - Yes
                  - Hepatitis B surface antigen Positive (HBsAg)?
                    - Yes
                      - Was IgM antibody to hepatitis B core antigen (anti-HBcIgM) done?
                        - Yes
                          - Anti-HBcIgM Positive?
                            - Yes
                              - Confirmed case
                            - No
                              - Not an acute case
                        - No
                          - Not an acute case
                    - No
                      - Not a Texas case. Report case to EAIDU for referral to case’s residential state.
                - No
                  - Not an acute case
            - No
              - Did the case have a negative hepatitis B surface antigen (HBsAg) test within the last 6 months and have a positive HBsAg, Hepatitis B antigen (HBeAg), or hepatitis B virus nucleic acid test (NAT) now?
                - Yes
                  - Has the case been previously identified as an acute or chronic case?
                    - Yes
                      - Not a Texas case. Report case to EAIDU for referral to case’s residential state.
                    - No
                      - Not an acute case
                - No
                  - Not a Texas case. Report case to EAIDU for referral to case’s residential state.
