

Texas Vaccines for Children (TVFC) and Adult Safety Net (ASN) program provider,

Effective May 1, 2024, Maximum Stock Level (MSL) calculation will be updated in the Vaccine Allocation and Ordering System (VAOS). This change is part of ongoing efforts to improve inventory management and ensure accurate ordering suggestions.

Key Changes:

- MSLs will use a rolling 12-month period to calculate an average 75-day supply for the TVFC and ASN programs.
- Between June and September, MSLs will be updated by using the same rolling 12-month period to calculate a higher 75-day supply needed for back-to-school.

TVFC and ASN providers should review current inventory levels and adjust orders to avoid disruptions in vaccine supply. Ensure historical records of doses administered are submitted and kept up to date using the Doses Administered History page in the VAOS Provider Portal.

If you have any questions, contact us at TXVaccineOrders@dshs.texas.gov.

Thank you for your continued partnership,
