

Stop New World Screwworm

As producers or farm owners, you play a crucial role in keeping your farm and employees safe. Help your employees protect themselves by teaching them how to recognize NWS, sharing steps to prevent NWS infestations, and supporting them if they report a possible case.

New World screwworm (NWS) flies lay eggs in open wounds on animals and people. Their larvae eat living flesh, making wounds larger and more painful. Flies can lay eggs in wounds as small as a bug bite.

1. KNOW THE SIGNS OF NWS

Train employees to look for signs in people:

- Seeing or feeling larvae moving in a wound or sore, ears, nose, eyes, mouth, or genitals.
- Painful skin wounds or sores that get worse or don't heal after a few days.
- A bad smell or bleeding from a wound.
- Movement or an itchy feeling in the wound.

Encourage employees to report concerns of NWS and seek medical care right away if they notice any of these signs.

2. PREVENT NWS AT WORK

Help employees protect their skin and prevent bug bites.

- Encourage employees to keep open wounds clean and covered.
- Provide adhesive bandages, disinfectants, and gauze pads for employees to cover any break in the skin.
- Encourage employees to wear loose, long-sleeved shirts, pants, socks, and hats to limit bug bites.
- Provide EPA-registered insect repellent and enough to reapply during their shift.
- Instruct employees to not apply insecticide for animals on their skin.

Explain why covering wounds and keeping bugs away are important to prevent NWS.

3. MAKE REPORTING AND ACCESS TO CARE EASY

Plan ahead so employees know what to do if they see larvae in people or animals or think they have NWS.

- Encourage employees to report any sign of larvae right away.
- Make sure they know they won't be punished for reporting.
- Instruct employees to not remove the larvae themselves.
- Identify where employees can seek and receive medical care quickly to prevent NWS from spreading.

If larvae or eggs fall out of a wound, tell employees to collect them in a leak-proof container to save for a doctor or veterinarian. If available, add rubbing alcohol to the container to kill and preserve them.
